First, a "spy" is not going to need to build a radio. They will be
able to get their hands on something locally, or (as in WWII), they'll
be parachuted in with the needed equipment. And in this day and age,
with so many means of communication (and at least for the moment, no
all-encompassing wars), there are all kinds of mainstream means of
contacting spies without being tracked. Traditionally, spies were not
radio experts, unless their job was to accumulate information on
radio matters.

But, if someone really did need to assemble a shortwave radio, I
suspect it's far easier today than in the past. At the very least,
no more difficult than in the past.

Thirty years ago, magazines were full of simple superhets based
on standard AM radios. Some would rework the front end
circuitry to tune a shortwave band, and the fact that ICs are

used rather than transistors isn't likely to make that really difficult. I can remember in 1971 when RCA introduced the CA3088 AM radio IC, and QST ran an article pointing out how it could be used. Obviously not the best choice, but an IC instead of transistors isn't likely to make a worse receiver. The limitations would come from image rejection and lousy selectivity (and maybe lack of IF gain), and those were all there with transistor based radios.

Others would strip off the front end tuned circuits, and simply use the AM broadcast receiver as a 455KHz IF, building a mixer and oscillator to feed into it.

And of course, many would add a converter to an existing AM broadcast radio. Sacrifice one radio to build a converter for another. Then you get double conversion, which would be a good thing given the common 455KHz IF for most AM broadcast radios. For best results, use a car radio for the radio, since they often have better selectivity and of course are well shielded compared to portable AM radios with their loopstick antennas. Need a BFO? Those can be tossed together easily with a transistor off some scrap board, and an IF transformer from a scrap radio (and I seem to recall some using ceramic filters as the frequency determining element in a BFO, and if those work, they are easily available out of scrap radios, compared to ceramic resonators).

ICs may offer better performance. Since transistors in an IC are cheap, they may be more likely to use a balanced mixer. Grab an IC out of a radio, and you've got your mixer (and you have a choice of the mixer from the AM or the mixer from the FM section). Some have put together SSB receivers out of narrow-band FM receiver ICs (they simply ignore the FM detector), and someone used merely the mixer out of a more complicated receiver IC for a direct conversion receiver. A lot of FM broadcast radios use IF strip ICs that don't allow for separate use of the IF amplifiers from the limiters, but I've stripped at least one car radio that offered up an MC1350 IF amplifier. For that matter, use the FM IF strip as a quasi-synchronous detector for AM, or if it's of the right design, feed a BFO into the limiter input and you've got your product detector.

Find a CB set, and you get better IF selectivity, and many will be double conversion. Retune the front end, and replace the synthesizer with a tuneable oscillator. Get really lucky, and the garage sale will offer up an SSB CB set, for even narrower selectivity and of course CW/SSB reception with no mods.

Circa 1942, you'd have far more trouble getting parts. Oh, I suppose there were more local electronic stores, but there was hardly any consumer electronic equipment. Nowadays it's really really common. And that supplies so many useful parts.

Using a standard IF is a bad idea if you are a spy, since the local oscillator is going to be at a standard offset of known number stations.

According to the "Spycatcher" book, MI5 used local oscillator leakage to track down spies already in the 1950's. Thus, if standard IF is used, at least shield the oscillator very well and use some RF stages to isolate the antenna from the local oscillator.

The police in some countries use the local oscillator radiation to detect illegal speed trap radar detectors.

This is the 21st century!

All one needs to do is post a seemingly ordinary message (like this one)
in any newsgroup (like one dealing with Disney movies). Use the public
library and a pre-arranged name. Bingo! The message appears near
instantly all over the world, and in convenient, printer-friendly format.;-)

Even easier on the receiving end. Come on guys!

Chuck

I think using radio broadcasts as a means to communicate information to a
global 'spy' network has become passe. Modern spy and terrorist networks
increasingly use a method called 'Steganography' to hide messages and data
inside picture files or other media files that are easily posted through the
internet.
Lot's of free software to do this can be found on the net. Here's a link to
a tutorial:

http://elonka.com/stego/StegoLR.htm

Do you plan to abolish every activity that does not "provide a thing
for the country"? Simply ridiculous! Sounds like Stalin's Russia to me.

As an American your view of amateur radio is, typically, all about
kicking up the dust in your own backyard. American is merely a part
of the world of amateur radio.

Instead of spamming across the various radio newsgroups why don't
you go and bother your congressman with your ill-conceived ideas and
leave the rest of us to enjoy our hobby.

And, some speeders turn the tables, by monitoring for the LO radiation
from police-band radios... assuming that where there's Smokey, there's
radar-fire.

9. Squegging in LC oscillators

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-01-02 15:55:29 UTC
From: Tim Shoppa <shoppa@trailing-edge.com>
Message-ID: <1167753329.259479.53680@k21g2000cwa.googlegroups.com>
Source record: 8898
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.boatanchors,sci.electronics.design

I have been playing around with my homebrew VFO, a Hartley oscillator, with a tapped inductor in the tank.

Rough parameters: 6AH6 pentode for the VFO, tank resonant at 1.8Mc, plate circuit resonant at 3.6Mc. Rather low-Q plate tank (on purpose, I want it to cover 100kc or so). Tank tapped about 1/3 of the way from the bottom. 150V from an 0A2 on the screen, bypassed by a 0.005 uF ceramic with short leads at the screen.

While playing around with it I found this weird mode where it wouldn't necessarily start up in constant oscillation. It would repeatedly (30000 times a second) start up (starting up very quickly, in just a few cycles), grid and cathode circuit amplitude would build up to about 10V p-p, then the oscillations would slowly (over the next 30 microseconds) die down. Then it would repeat.

Hand capacitance near the grid or on the tank coil would often break it out of this mode and into more regular oscillation. Putting a 10x scope probe on the grid sometimes broke it out of this mode too.

What eventually made the circuit more reliable was putting a few hundred ohms in series with the grid. But I don't understand exactly how this helped.

My guess for this squegging mode is that the oscillator would suddenly start, the tank would ring, the tank would ring hard enough that grid current flowed, and that the grid current somehow would "latch" on until oscillation died out, then it would repeat.

Or, just maybe, it's more closely related to screen current and maybe some kind of oscillation of the 0A2 in the screen regulator. I tried changing the dropping resistor feeding the 0A2 and a couple different 0A2's but the squegging seemed relatively insensitive to it.

Trying some other pentodes that were not so "hot" (e.g. 6AU6, 6BA6) changed the squegging a little but it was still there.

My not-understood fix, putting a few hundred ohms in series with the grid, is something that I've often seen in real-world circuits. I think this is to provide some degeneration, and always was under the impression that the degeneration was intended to prevent oscillation in the VHF range. It is possible that the circuit was indeed oscillating at a few hundred Mc but my scope (100Mc bandwidth) didn't see it. And I don't know how a 200Mc parasitic might cause 30kc squegging.

Any thoughts?

Tim KA0BTD

(snip)

(my guess)
The grid acts as a rectifier that builds a DC grid bias
voltage from the rectified AC signal, biasing the tube off.
Then the tank dies a natural death. Adding the series
resistor reduced the efficiency of the rectification.

Sounds like you have too much positive feedback, to begin with.

But in a "normal-functioning" oscillator, the DC grid bias doesn't cut things off for so long, right?

The P-P amplitude at the grid (as seen by my 10x scope probe) when the circuit is not squegging is in fact larger than when it is squegging.

I suppose it is possible there's some weird kink in tube characteristics for all the pentodes I tried.

> Adding the series
> resistor reduced the efficiency of the rectification.
>
> Sounds like you have too much positive feedback, to begin with.

Probably, but moving the tap on the tank coil had little effect. The handbook says about a third of the way up from the ground end, but I tried it at a half, two-thirds, one-tenth, etc. It did alter the shape and timing of the squegging a little bit but it was still squegging. If I moved it too far the circuit didn't oscillate at all (too little feedback).

Also, changing the biasing (trying to move it further into class A) by putting a cathode resistor in didn't help much either.

Tim.

Right. If you don't have way too much loop gain, the bias
just shifts enough from the grid leak effect to slightly
lower the loop gain so that a stable oscillation takes
place. The negative feedback loop that adjusts this gain
adjustment effect can be stable or unstable.

My concept may be over simplified, and not include
everything that is happening. I would look at the screen
bias voltage during the squeeging to see if it is also
bouncing with it, or remains stable through a cycle.

Spice is your friend. I have found that LT spice is particularly good
at predicting squegging, at least in general. There's never a 1:1
correspondence with the real thing, but close is pretty good in RF.

When I have experienced squegging like this it has been because I have
built a circuit with a resonance between the circuit capacitances and
the RF chokes (you know -- those things you use for biasing that you
treat as 'shorts' in your AC analysis?). To the bias circuit, the
oscillator looks like a negative resistance, so you get two modes of
oscillation at once.

This is complicated by the fact that the circuit wouldn't oscillate at
the lower frequency at all if it weren't for the action of the intended
oscillation -- it's the current requirements of the active device as
oscillation build up that cause the negative resistance action that
causes squegging.

I suspect that your grid resistor is killing the Q of the circuit at
30kHz, which kills the squegging without killing the intended mode of
oscillation. You may find that loading any bias chokes with carefully
selected, unbypassed series resistance will also kill the squegging.
You can also sometimes kill it by reducing selected bypass capacitances
to lower the circuit Q at the squegging frequency.

Of course all of this also lowers the circuit Q at the desired
oscillation frequency -- that's life. Your job is to find a happy
medium that gives you good oscillator performance without squegging. Or
start building superregenerative receivers!

Wow, man, if I make it happen again I see the screen voltage motorboating up and down by about 3V (around the nominal 150V) at about 30kc.

Changing the screen bypass capacitor between 680pf/0.001/0.002/0.005/0.010 and changing the current through the 0A2 between 5mA and 10mA and 20mA and 30mA doesn't stop the squegging but it does somewhat alter the timing/amplitude.

Plate can be held at a steadyish 350V (even bypassed) through all this.

So this is something like the textbook squegging which seems to be something like a motorboating of the plate voltage, but in my case I see it in the nominally regulated screen instead. New one for me!

I don't think this is quite like the typical NE-2 relaxation oscillator circuit, because I thought 0A2's were supposed to be stable with these small amounts of capacitance and the behavior seems independent of room lighting, but I could be wrong. The screen voltage waveform sure as hell looks like a relaxation oscillator at 30kc.

Looking at my old schematics I see my Heath HW-16 crystal oscillator puts the crystal between the screen and the grid of a 6CL6. Manual says that the screen is serving as the plate of the oscillator. Probably completely unrelated to the intended operation of my oscillator (where I bypass the screen and the leads are short) but may be related to the unintended mode of operation!

Tim.

I think you are talking yourself out of the problem.

It sounds like you are trying to build an electron-coupled Hartley
oscillator. There is no way that a voltage change of 3 volts on the screen
(which is functioning as the anode, for Hartley purposes) is going to start

and stop the oscillator.

Watch the DC voltage on the grid. You will see it follow the relaxation oscillator waveform when the thing is squegging.

The fundamental problem is two-fold. First, too much feedback. Second, the time constant of the grid circuit is too long. The stored energy in the tank can continue to charge the coupling cap even after the plate current is cut off, and it can't start to oscillate again until the charge on the coupling cap bleeds off.

Start by lowering the grid circuit resistance and lowering the capacitance of the grid coupling capacitor. This will work to cure both evils. Taking a quick look at the 6AH6 curves I would guess that, at 6 MHz, your coupling cap should be about 22pF and the grid return about 10K. The 6AH6 is also a sharp-cutoff pentode, so it will be very sensitive to small grid voltage changes near cut-off.

Don't get distracted by the swings in screen volts, you are just drawing large pulses of current and pulling the supply down. Unless the 0A2 is going out of conduction RC oscillation is unlikely.

What you write, which relates the Q (probably very low hundreds) of the tuned circuit and it's frequency to the period the squegging, is in good agreement with the squegging I observe. Will check the DC grid voltage with the scope tonight.

The grid tuned circuit is at 1.8Mc, and the squegging seemed insensitive to the coupling cap. 100pF is the handbook value, but I did play around with it. Too small (39pF) and no oscillation. At 56pF there was squegging.

Did not try playing with the grid return value (still at 47K from the handbook), that may indeed be the key.

Tim.

The circuit is the "tuned plate Hartley" as it appeared in any
50's/60's/70's ARRL handbook.

The grid tuned circuit is at 1.8Mc, the bottom end of the inductor is
grounded, there's a tap nominally one third of the way up to the
cathode, and the top of the inductor is connected via a 100pF capacitor
to the grid, which has a 47K to ground.

The plate circuit in my current incarnation is tuned to the harmonic at
3.6Mc. The "untuned plate" version in the handbook has a RF choke
instead of a plate tuned circuit, and indeed I had this on the bench
for a little while.

Tim.

I normally don't post, but, since I have done my own amount of torturing of
the 6AH6, I think i know what the problem is.

The 6AH6 is slightly misnamed.
The 6AH6 isn't really a pentode.
It's just a really small beam power tetrode.
It has usable gain up to the UHF region.
And it suffers a lot of the same personality disorders of it's larger
brothers.

It's rated at 3.2 watts plate dissipation.
But I have ran it close up to about 12.5 watts for extended periods.
At that point, the tube starts to show obvious signs that it's close to the
breaking point.
The plate starts glow red, but it didn't kill it.
Probably hurt it a good amount, but it didn't kill it.

The more current it pulls, and the lower the input and output impedance,
the higher the tendency for it to break into oscillation.
It will oscillate up to the UHF region easily.
It's preferred method of oscillation is the grounded grid form.
The cathode is the input, and the anode is the output.

When you have low resistance feedback loop from the plate to the cathode
over six or so inches long, and start pulling a good bit of power, then it
can go at any time.

Look up parasitic oscillation in your handbook..
You will see the circuit that is causing it.
Large power tubes top out at 100Mc or so.
But this small one can go up to 400 to 900Mc if it's being driven hard
enough.

The loop is most likely from your plate, through the tuning cap of the
output tank.
The cap will look like a short circuit at UHF.
It will then go through the chassis.

And then through the cathode tank, which is shorted by the tank cap at UHF.

Ways to solve the problem.
Turn down the plate, and screen voltage.
It will drop beam current.
That will increase the resistance of the tube to the point it can't
parasitically oscillate.

Or you could put a 100 ohm or 1000 ohm resistor in the plate circuit.
In big amplifiers, where you can't tolerate a large resistance in the plate
lead,
they use parasitic chokes.
The appear as a short to DC, and the desired operating frequency.
But they appear as a high resistance to the VHF oscillating frequency.
It basically de-Qs the VHF oscillating circuit.

But you can tolerate a little bit of loss in the plate circuit of this unit.
So, just put a 100 ohm resistor in series with the plate.
If that don't work, then try a 1K resistor.
I am pretty sure that it will settle down and behave.
It will be a lot easier that winding a parasitic choke for it.

You also want to take a careful look at the screen circuit.
It can also act like an output in a parasitic oscillation.
So, try putting a 100, or 1K resistor in series with it too.

It's oscillating cycle.
It starts it's HF oscillation gain cycle.
The signal grows, and the tube bias increases.
The current on the positive peaks grown with it.
The current on the positive peaks get to the point that
the tube breaks into UHF oscillation.
The UHF oscillations are several times larger than the intended oscillation.
The UHF oscillation only last a fraction of the high frequency cycle.
When it starts it's UHF oscillation, it quickly charges the grid capacitor
up to a very high level.
Way past cutoff.
The UHF oscillation quickly extinguishes it's self.
But since the tube is in cutoff, the intended HF oscillation dies too.
The grid voltage drops back to normal, and the tube starts the cycle again.

Other ideas
You could also increase the grid leak resistance.
Push it up to 1M or so.
It will decrease the tank loading, and allow it to start easier.
And it won't pull so much positive peak grid current,
and cause the tube to conduct so heavily on the positive peaks.

You can tease out the UHF oscillation into the open if you short the primary
grid tank,
so it can't oscillate at it's intended frequency.
Basically, zero signal condition.

Then, push up the plate, and screen voltage.
If you have a little signal strength meter that works up to the UHF range,
with it's antenna clipped to the chassis, or wiring.
You will se it start to come alive.
You will be able to move your hand around the unit,
and it will break into, and out of oscillation.
Sometimes, it will motorboat, or operate continuously.

You want to change the circuit so that you can't get it go parasitic,
even when you really push it to it's limits..

Then un-short the tank and you are ready to go.

Tim,

My guess is the OA2 (Neon) and Cap combination is causing the problem.
Isn't that an oscillator in itself ?

Try replacing the OA2 with a Zener (or 3 in series). It may be a bit
noisy, but it may also be stable.

Or... a pair of resistors to derive 150V from HT. Just to see if squeg.
stability improves/changes. 15k + 18k for a 350V HT (just a guess).

OK, I saw the parasitic last night!

I only have a 100MHz scope. Putting a scope probe on the circuit seems to often kill the squegging. But I put a little loop on the end of the scope probe and sniffed around, and indeed there was a 400MHz parasitic that would build up over maybe 0.1usec. Then the impulse from this set the tank ringing at 1.8MHz, and after the ringing mostly decayed (30usec or so) the cycle would repeat.

There seemed to be the most energy at the well-bypassed screen and not at the plate, but remember this is an electron-coupled oscillator so the screen is working as a plate.

I guess even a 0.001uF ceramic cap with short leads isn't a good bypass for 400MHz!

There must've been substantial 400MHz energy to show up on my 100MHz scope :-).

My band-aid of a resistor in series with the grid seems to do the trick.

Tim.

Your resistor in series with the grid would have much more effect on a
UHF oscillation than on one at 30kHz, indeed.

Even a 1nF chip cap soldered directly between the screen lead and
cathode of the tube would have the internal tube lead inductances to
contend with, so you're probably never going to 'get there from here' by
that method.

I wonder if a loading resistor in the screen lead instead of the grid
would work?

Nice post. A while ago, I went into "hair-pulling mode"
the other way - *trying* to cause squegging in a one
transistor DC-DC booster. Finally got it with a bit
of fiddling. Maybe it belongs under Murphy's section
on oscillators:

When you don't want oscillation, it will oscillate
When you want oscillation, it won't
When you want to get rid of squegging, you can't
When you want squegging, it won't

Do all Parisitics (sic) come from Paris? :-)

Yes.
My original reply also mentions that.

.....
You also want to take a careful look at the screen circuit.
It can also act like an output in a parasitic oscillation.
So, try putting a 100, or 1K resistor in series with it too.
.....

He says that the .001uf cap isn't much good at bypassing.
The problem is it's too good at bypassing.
It acts as a short to the UHF parasitic.
That allows enough UHF energy to be conducted to the chassis to allow it to go parasitic.
Shorting the energy to the chassis, isn't the cure to the problem, its the cause of the problem.

So I will clarify my previous statement.

You want a 100, or 1000 ohm resister in series with the screen.
Between the bypass cap, and the screen.
Not between the bypass cap, and the supply.

You want to isolate the capacitance from the screen.
That will break the loop required for oscillation.

I have a hard problem making a amplifier that can put out a solid 1.8Mhz
signal.
But I can build a DC power supply that produces a quality 80Mhz signal.

Maybe, if i want an oscillator, I should try to build a DC supply circuit,
and vice versa.
I will figure it out one of these days.

Since a 220 pf capacitor with ¼" leads self-resonates somewhere around 150 MHz., you might want to do the old "put a variable capacitor between screen and cathode and tune for minimum squeeg" trick. All you are doing is making a series resonant circuit with the stray inductance of the tube and the variable capacitor to short whatever nasties you don't want out.

If you're in a western country, sure... but I imagine there's still plenty of spying going on in eastern Europe, the middle east, Asia, etc. where Internet connections are nowhere near as easy to come by.

Of course there is satellite communication, but that's significantly more costly for everyone involved. Plenty of spying is just going to, e.g., local libraries, government officies, etc. and turning the vast volumes of data that if freely available into useful *information* for your own government... a very ho-hum sort of job that requires little if any technology.

34. Making vari-caps for ATU

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-01-04 16:08:21 UTC
From: Ceriel Nosforit <ceriel@googlemail.com>
Message-ID: <VD9nh.19224$AX.15603@reader1.news.saunalahti.fi>
Source record: 8923

Hi all!

I couldn't find a place that sells this type of variable capacitators, so I decided to build my own, but I think I could use the feedback of people who actually know what they're doing. Since I know none, I had to settle for r.r.a.h. (Just kidding!! ;D)

I don't have a DX license yet. I'll probably get one last when I decide I want to build a transmitter, but it'll be a good while until I know enough to do that. An ATU seemed a simple enough curcuit to start with, and it seems I'll be building every part of it from scratch. So, too late to cut to the chase, what I'm planning is using

32 aluminum plates
200 x 50 x 2 mm each
cut diagonally in half
to make 64 plates total
40 cm^2 actual surface area each
spaced 3 mm apart.

This should make a cap weighting in at 743 pF with a voltage tolerance of almost 9 kV according to the KI6GD Capacitator Calculator, if I'm using it right. I'm going to build two of them. It should be... enough. :)

http://img413.imageshack.us/my.php?image=pict3833tj4.jpg
http://img138.imageshack.us/my.php?image=pict3834eu7.jpg

First pic is of the plates I'm going to cut, and second is my schematic.

As you can see I'm going for an unusual shape with the plates. This is to minimize my work load. I'll just have to cut straight, drill a hole and file down the corners to prevent corona discharge. Once the caps are complete I'll just measure their values at different levels and make a chart or scale.

So r.r.a.h, if you are still reading, what has this humble newbie already screwed up? I know the sensitivity is going to be extremely high, but I should be able to fix that with some simple mechanics. My old LEGO bricks should do the trick, come to think of it...

Thank you very much for reading. Hope to see a reply, even if it's just "Go for it!" or "You've got it all backwards".

--
Sincerely,
Nosforit

Indeed this is a working fix, as I verified on the bench.

> It's oscillating cycle.
> It starts it's HF oscillation gain cycle.

Actually in my particular case it appears that the UHF parasitic starts
first. But probably just the luck of the bias point.

> The signal grows, and the tube bias increases.
> The current on the positive peaks grown with it.

Very true here - this is in fact the only time I've seen 400MHz stuff
on my 100MHz scope, so I'm guessing that there is substantial UHF
energy there.

> The UHF oscillation only last a fraction of the high frequency cycle.

This part is very true too. Tiny tiny fraction of a microsecond. My
interpretation of the scope trace is that the UHF activity gives the
the HF tank a "kick" and it rings for a while.

Tim.

> Sincerely,
> Nosforit

Well, this is basically a "go for it." I'm not quite clear on how you are going to stack up the plates when you're done...what holds them in position and so forth. One advantage of the "normal" semicircular plates is that there's not such a long piece of metal hanging off the rotor shaft as you will have, assuming the shaft runs through the "pointy" end of the rotor pieces. Beware of what vibration does to you, in other words. As thick as your plates are, I suppose that won't be a problem.

The widest-range variable I have is built with circular plates, with a tab off the edge of each through which the rotating shaft goes. There are actually two rotors, which are coupled through equal-size gears on each shaft, so one rotates clockwise as the other rotates counterclockwise. The plates go from full mesh to full separation, and give over 100:1 capacitance ratio from max to min. The shafts must be insulated from each other, of course. There's some advantage to a capacitor with a wide tuning range in an ATU, in getting the ATU to be able to cover a wide range of matching impedances over a wide range of frequencies. Anyway, I suppose you could do something similar with your rectangular plates.

Cheers,
Tom

Hi Folks,

I just found this group. Not sure if this is the right place to ask, but here goes:

I am presently a student studying for my MSc in Applied Physics. Next semester I have a course in Electronics which is going to require me to do a project. Now I have worked with radio control vehicles before (ROV's), but this time, I wanted to build a vehicle and have it be semi autonomous, ie with a microcontroller. Along with that, I will need a fairly long range (say, 1 mile) video transmitter to put "eyes" on the vehicle. I have worked with the short range, commercially available wireless video cameras that use the pinhole camera and have a range of about 300 feet unobstructed. I was wondering if anyone on this forum knows of a kit that I could purchase to build one myself (I may be mistaken, but an assembled unit probably costs a lot more). If this is not the right forum, pls let me know that too. Links, ideas, etc are welcomed.

TIA,

Joe

Hello Tom. Thank you for your reply. :)

I'll separate the plates with spacer disks and bolts on a 6 mm threaded
steel rod, indeed through the pointy ends. 6 mm is IMO too thin on its
own, but the disks and bolts should add a lot of stability. The entire
thing will be propped up on plexiglass plates at the ends, and I'll have
one additional 6 mm threaded steel rod where I marked 60 degrees on my
schematic. If it still not stable I'll add something to the top and bottom
to keep the rods stretched straight. If that still isn't enough, I'll have
to build some sort of support for the mid-section.

The blades will separate from each other more than completely, if I want
to. I don't know the electrical implications of what would happen if I did
so. I guess at some point the curcuit would simply be broken... Maybe
permanently? Either way, infinite ratio from max to min. ;)

I plan on either adding a counter-weight, a rubber band, or some mechanics to keep the rotor from simply falling down. A counter-weight should give a nice 'feel' to the dials, which is very important for any sense of "quality".

If the parts of the ATU turn out reasonably pretty I'll make an enclosure largely out of plexiglass for them. A cardboard box is however a lot more likely. I expect the end result to look horrible and work marginally better. XD

Ten Tec in USA offers a variable capacitor kit, max C is 500pf @ ~5kv.
Cost is about $80 USD. Takes about a hour to assemble. I use them in
a 1.5kw ATU and they work fine. Kit #1207.

If you get all the parts, cut them up, and assemble the whole thing,
homebrew, makes the $80 price tag seem reasonable. I could see you
spending more than half on just materials.

Good Luck,
Gary N4AST

Joe,

Before suggesting anything it would be helpful to know a little bit more about the requirements. Are you considering analog or digital TV transmission? What frame rate is required? How many horizontal lines? B/W or color? Are you planning on using amateur radio or unlicensed frequency bands? How long are the transmissions? Any size/weight constraints?

There are many tradeoffs to be considered. For example if you are sending digital pictures, the frame rate, vertical and horizontal resolution, and color depth will dictate the data rate in bits/second. Based on a given data rate there will now be tradeoffs in terms of frequency band, power, bandwidth, SNR, antenna size, power supply requirements etc.

We also need to know if you are considering building something at the component level or whether you are trying to use off-the-shelf modules.

Sounds like a fun project - Roger

Hello Roger,

Whew! Well, I am glad you asked. I would like to use the KISS principle, if you know what I mean. I will try to answer in the order you asked: Analog TV, actually, I would like to use my own TV, like maybe cable channel 59 (I know we have some video bandwidth around there, 70cm) at least for the initial close to home testing. However, there is a possibility (remember, this is still a work in progress) that I will want to monitor the video from my vehicle in a field type test situation, in which case I have a couple of smaller color monitors that run on 12V and use RCA phone jacks, so I would need a receiver box to plug into the monitor. Definitely color TV and I thought that , given the range requirement of about a mile, I would need to use the amateur band. If not, that's fine too. Length of transmissions, now I hadn't thought about that one. I was planning on sending him on his way, as I said, semi autonomously (with a microcontroller taking care of all the things like not bumping into anything, going off cliffs, or ending up in the drink), and then send a command (possibly DTMF thru walkie talkie) to switch on the video and start monitoring where he (well, it) was located and what he was seeing. The size, weight and power constraints: It is to be an all terrain type vehicle, right now I am planning on using a steel platform (actually, one of those radio flyer wagons) which weighs about 10 lbs unloaded. I would estimate that after adding the motors and wheels (big wheels, like maybe 12-14 inch diameter), 12V deep cycle battery (about another 40 to 60 lbs), I may be able to accomodate another 5 lbs or so for the camera, and transmitter, and possibly another separate power supply (battery) for the camera since I will be using a 6V (4.5AH) battery to power the microcontroller and associated electronics, sensors and whatnot. I would rather have the 12V battery powering the DC motors that will be propelling him forward (they will probably be pulling 3-5 Amps each). So there will also probably be inductive 'noise' from the motors as well, but I believe I can shield most of that, if necessary. I always prefer to use off the shelf items, but I can do some soldering and putting kits together also. I guess to summarize, it is very flexible in this stage, as I haven't gotten the motors or wheels together yet, I am still planning all this and trying to cover all my bases so that I can have something working possibly by the early summer when semester ends. I have done this before, but on a much smaller scale and limited only to ROV's using off the shelf radio control non amateur band. I realize there will have to be tradeoffs, e.g., I may have to go with black and white instead of color, I may not need a mile range for the video transmission,etc. I think TV resolution is 480 lines. That would be ideal. I guess I am wondering what is out there for me to choose from and then tailor make this part of the project based on my budget and what is available. Also, I may not necessarily be line of sight when I will be needing the video (in a field test situation). I really

don't know about transmission times.

Oh yes, it's going to be fun..It already is :--]]]

Joe,

Given that you plan to transmit analog television transmission you will want to operate on the ham bands. The unlicensed stuff will not have the 1 mile range given the bandwidth and SNR requirements.

I suggest you get a recent copy of the ARRL Handbook. Chapter 9 has a section on Amateur Television (ATV) and Radio Control. There is an example of ATV mounted on a model Humvee.

There is a lot of good info on the ARRL site at http://www.arrl.org/tis/info/atv.html

Google is your friend - a search on "amateur television" gave lots of sites with interesting equipment that can be purchased or built. There are groups and forums where you will get lots of practical tips.

Roger

You can get a mile unobstructed with WiFi, and it does tend to be a little less expensive than ATV. However, to get that sort of range does rely on using a channel within the amateur spectrum, and more significantly, requires a lot of antenna gain, unless you move to a lot of power which again gets expensive. Depending on your vehicle, that sort of antenna gain might not be practical. Relatively small WiFi antennas can be astonishingly directional.

You might also consider 900 MHz. This allows more reasonable antennas than 440 and equipment is still somewhat inexpensive, although not as widely available as WiFi. It is a little easier to get the mile on 900 MHz than 2.4 GHz. (been there, ran the tests). On 440 you are likely to encounter QRM (I'm assuming from the 1 call you are in the upper right there where there's a bunch of people) and antennas are going to be larger, something of a problem for your vehicle. ATV receivers for 900 MHz are fairly inexpensive.

I assume you are going to rely on the vehicle for camera positioning, or you are going to build it yourself. If you want to buy pan/tilt/zoom capability, then digital gets dramatically cheaper.

I'm doing a random wire "semi-automatic" tuner, and also trying to make varicaps for it. I found a eBay seller from Germany, if I remember right, who sells ready-made air-varicap plates. I bought few dosens of them for 20 euros. I think the seller ships worldwide. I'm sure there is other producers too...

I would like to know what the actual OD is of schedule 40 PVC tubing.
I am building a NVIS dipole for 3.6 & 7.2 Mhz
I know what the wall thickness is and the nominal size, but say for instance
the OD of 1 1/2" schedule 40, is it really the OD they are measuring?

Here in Australia we have a quaint method of measuring structural steel pipe
where the OD is nothing like the size its listed at.

For example 3/4" pipe is actually 1 1/16 OD!! Give or take the wall
thickness, but its still known as 3/4" pipe!

Thanks
John

That's a rather good deal. I paid 25€ for material costs and an additional
5€ to my neighbour who got them for me. My brother who teaches handicrafts
at a school is going to let me use the workshop to do the rest of the
work, so right now I'm looking at a cost of 33€ for materials, but I still
haven't bought the plexiglass.

How is your tuner going to be semi-automatic, if I may ask?

p.s I can see you're a fellow Finn aswell, so here is a rather useful link
I found earlier today:
http://www.tkk.fi/Misc/Electronics/faq/sfnet.harrastus.elektroniikka/liikkeita.html
I'm sure Vekoy is a familiar place for you already, but still... ;)

Those are not all that awful prices for the rest of their kits... The BFO circuit looks especially tempting. I'll be sure to check it again when I decide I'm going to build an actual radio. Thanks for the link!

> How is your tuner going to be semi-automatic, if I may ask?
==========
Suggest you consider a stepper motor from a dumped
printer/scanner/floppy drive or HD ,if necessary including a shaft
rotational reducer when steps are too big.
Google will provide you with suitable (simple) circuits to drive the
motor ,usually involving one or more opamps.
From semi-automatic the circuit can evolve towards a fully automatic
system with a SWR sensing circuit.

There's a short but interesting story behind that on the link above.

Thank you Roger. My copy is about two years old. I will look thru it
and see if it contains any more information.

Check for dynatron oscillations; the screen acts as a plate, sort of.
http://en.wikipedia.org/wiki/Dynatron_oscillator

I can't find a schematic of one, but it's just an oscillator with feedback
from the screen to the grid.

How long are the leads of your screen bypass cap, and where are they
soldered down?

Thanks,
Rich

I've been working on a high-power HF autotuner design that I'd just about shelved because of the necessity of soldering the DDS chip. (it uses an internal RF source to power the phase detector)

This thread has helped a lot. When time permits I may order up some parts and give it a try. I have a good-quality magnifier lamp and a fine-point temp-controlled pencil, what I don't have is OEM eye lenses and flexible finger joints... ;-)

Most of my SMD work is done using half-moon reading glasses - the strongest and cheapest available from the drugstore - in front of my normal glasses. When not in use, they hang from a neck cord.

After publishing this suggestion, a very generous person *gave* me a professional-quality binocular microscope. This is wonderful for big jobs like assembling a whole new board... but to be honest, I still tend to use the double glasses more, because the "setup process" is much quicker.

You will find that the tip of the soldering iron becomes much steadier when seen under the magnifier. This feedback loop is a wonderful thing, especially if you give it the best possible chance to work:

* "Use the scope, Luke!" - learn to concentrate exclusively on what you're SEEING. This is harder than it seems, because for normal soldering we also rely a lot on our sense of touch, and automatically tend to press the tip of the iron against the parts being soldered. With SMD this is a disaster - it simply pushes the parts out of position - so you need to break that habit and concentrate on using ONLY your eyes.

* Steady your arm against the edge of the bench, so you're not trying to stabilize your whole body.

* Stay off the caffeine - it creates a fine tremor that the brain cannot stabilize (too much "noise" in the feedback loop).

63. FM XMTR distortion measurements

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-01-06 17:29:29 UTC
From: chuck <nospam@nospam.org>
Message-ID: <1168104654_7873@sp6iad.superfeed.net>
Source record: 8852

In making FM transmitter distortion measurements, does anyone inject the 1 kHz audio signal into an FM transmitter by holding the microphone next to a speaker? It would seem that neither speaker nor microphone would produce enough distortion of a single frequency to affect the results, and in any case, the microphone is part of the system being tested.

The idea would be to avoid having to fiddle with the variety of microphone connectors out there.

I suppose I can and should compare the results of this technique with applying the audio signal directly to the microphone input terminal.

Appreciate any thoughts. TIA.

Chuck

Applying the signal to the microphone input terminals addresses just
part of a system, allowing you to point to the transmitter itself and
either say "that is a problem" or "that is not a problem". Applying the
signal to the system as a whole only lets you wave a hand at your bench
and say "somewhere over there, there is a problem".

I'd check transmitter and microphone separately. Then if they passed
and I'm feeling conscientious I'd check them together.

You know... I just happen to have two old floppy drives in my drawer.
Might be able to control them as they are through the standard cable if I
have the right software. Would just have to make another mechanical
modification to put the motion to use. A standard diskette might come in
handy for that. :)

Excellent idea! Thanks!

You have to control the levels so that the transmitter doesn't get
driven into deviation limiting. Usually testing is done at 60% of system
deviation. I am assuming this is a land mobile transmitter? Connecting a
tone generator to the microphone terminals is best way to control the test.

The problem with a 10x microscope is first FINDING the soldering iron
tip in the field of view. If I am looking into the microscope and
trying to place the iron on the work often the iron ends up way in left
field (or I push it into my other hand OUCH!) TOO much magnification
can be TOO much of a good thing. I wish I had another set of eye piece
lenses (or an other objective) so I could go down to 5X sometimes.

My microscope is a true binocular with poro prisms and dual objective
and eyepiece lenses. It was a 'gift' from a former employer (they were
cleaning up the lab and threw it out). I did have to jury rig a stand
since only the optic head was found in the trash, the unit originally
mounted on a long spring loaded 'gooseneek', like those circleline

magnifier lamps. (One of the focus knobs is cracked in half, but I can
live with that).

Thanks for the tips, gents.
Sounds like a binocular microscope would be a great tool; otherwise I
suspect depth perception might be an issue.

I'll keep an eye out for one.

>suspect depth perception might be an issue.
>
It still is an issue, because a microscope prevents you from using one of the most natural ways of perceiving depth, by looking at the board from a few different angles. Only a head-mounted viewer allows this.

A large lens on a spring arm is a kind of half-way option, but it rapidly loses quality at off-axis angles.

Another problem that needs to be mentioned is focusing and depth of focus. With a microscope, you have to put down the iron or the solder in order to adjust the focus. With a head-mounted viewer, you simply move your head to re-focus... but by the end of the day you'll probably have neck strain.

Also we haven't mentioned lighting. All microscopes tend to suffer from poor light-gathering power, so the work area needs to be very brightly lit.

While we're on the subject, a friend has come up with yet another option. Like many of us, he has a very good detachable zoom lens for a 35mm camera that he doesn't use any more. He has fixed this onto a low-cost colour CCTV camera, and positioned it about 4 feet above the workbench, looking straight down. This gives a moderately magnified view of the work area on a TV monitor directly in front of him.

This has the big advantage of leaving the workspace completely unobstructed, so he can switch very easily and naturally between the monitor and the direct view. He reports that it avoids a lot of the eye and neck strain.

The main practical problem that he still has to solve is "camera shake", because of viewing from such a long distance. In his case, the camera is mounted from the roof of a wooden shack, so he can't do SMD work on a windy day.

If you have a suitable lens and a CCTV camera, this option would be well worth trying.

Try the dial knob just behind the mic gain, this should be the control to adjust the power. CCW to decrease/CW to increase. 73' de aa8wl, Sam

Hello All,

I am soon to take my "tech" license test and would very much like my first contact to be QRP. I know that CW is not a favorite topic of conversation on most amateur radio newsgroups/message boards, but I find it a fascinating mode and am eager to learn it and master it.

At 60 years of age, it has been a challenge to master the little that I have learned.

Can you please post your favorite QRP/CW tutorial sites to assist me? I'm also looking for recommendations for a first QRP rig, new or previously owned.

Many thanks for taking the time to respond!

Alain

The definitive list of QRP links is at

http://www.qrparci.org/component/option,com_weblinks/Itemid,23/lang,en/

If you want to have so much fun it should be illegal, plan to attend the annual QRP gathering at Dayton

http://www.qrparci.org/content/view/1965/118/lang,en/

This is a pretty big effort for some folks, but between all the events over the four days, it is so much fun you just can't believe it. "They say" Thursday to Sunday, but actually the fun starts Wednesday evening, and it pretty well wraps up Saturday night. Friday and Saturday during the day it gets a little slow because some folks head over to some sort of thing at the Hara Arena, but the real fun is at Fairborn.

For information on Morse, especially about learning it well enough to make it fun, try

http://www.k7qo.net/

There is also some good building information on Chuck's page. Chuck used to have some excellent information on the Small Wonder Labs SW+ series of QRP rigs, any which are a very good choice as a first kit. One of the reasons it is a great first choice is the Elmer 101 site

http://epic.mcmaster.ca/~elmer101/

To learn about rigs, people's experiences, and to see what folks have for sale, the QRP-L reflector is the watering hole for most QRPers.

http://mailman.qth.net/mailman/listinfo/qrp-l

Beware ... this is a VERY BUSY email reflector. Unfortunately, you need to sign up to see the archives. There are unofficial archives elsewhere, but I don't have the URL.

This should keep your hunger for data fed for a while <g>

..

Now that has potential:

By pure coincidence, I already have a Sony HDR-SR1 high-def (1080i)
camcorder and a 21" 16:9 LCD display with HDMI input in the lab.

Putting those two devices together and adding an appropriate macro lens
would seem to be a natural thing for this kind of work.

Great idea, Ian!

One can find similar devices on the used market from time to time,
made for folks who are visually-impaired. My late wife left me one,
but it's up in Canada. I hope to retrieve it this coming summer.

Not my own idea, but a friend's. He particularly likes having the camera a long way above the work, so the area in front of him is completely clear.

Come to think, my dentist has very a similar system as part of his fancy new workstation, which is styled like the bridge of the Starship Enterprise.

I wish to extend my thanks to all who helped me with my question on wireless video transmission for my project.

Besides the replies I received on this forum, I also received a number of private email replies which gave me links to vendors, homebrew sites, etc.

I now have a lot of 'absorbing' to do, so I will go about it.

Thank you all again,

Joe

I see there will always be those people that can predict the future. The No Code is just going to bring in Bank Robbers, Rapist, and thieves, Murder's. Wife beater's, And the MOB.
Come on grow up children. You learned the Code and that's just Great, but do you really really have to pick on those that didn't have too..... like they should be lower than life and feel dirtier then a used pair of underwear. You are not showing your Intelligent as little people. When you could be there to help them feel like they had joined up with a great bunch of people. What are you a big bunch of Whiners. Your sounding more like your mad you had to learn it,and your pi$$ed off that they didn't. You don't own the Hobby of Ham Radio!!!!!!!!!!!!!!!! Your suppose to be the best part Of it. Not the worst part... Get a life your acting like it will be the end of the world.
Get involved in a real cause ,like people trying to take away your right's. Like the right to bear Arm's, and the right to live in a good and just community. And not one riddled with crime, and Murder. These are just good people wanting to talk on the Ham Band's. Not everybody wants to be a Radio operator. The people that will come into Ham Radio will be people that enjoy talking on the Radio, and if they don't they'll leave and go on to newer and different thing's... Your just trying to be a group of elitist... You don't OWN HAM RADIO PERIOD!!!!!!! Get over it Grow up and get a life. Do something get along for once. You don't have some big CLICK going on here. Anybody that can pass the test's is an OPERATOR!!!!

Tough Crap. It's a License to operate on Ham Band's. The same as it is to have a Driver's license to drive on the Highway's. You don't have a say in it. It's ran by the Government and that's that. Your just not going to be SPECIAL ANY MORE AND YOUR CRYING ABOUT..... STINKEN WHINER'S. What do you get if you put a Whiner on one end of a Teeter Totter and a Queer on the other..... NOTHING !!!! Nothing neither one knows when to SHUT UP...

Thank You for letting me say my peace. I know there a Great Hammer's out there. And you just don't hear them Bitching all the time.
I LOVE ROCK & ROLL. AND beautiful FAST woman Too.. HHHAAAAA HAAAA You got to love it.. It's called LIFE.

Jimmie

Hey, a couple years back I had a QSO with a guy using a 49 MHz
Teenage Mutant Ninja Turtle walkie talkie, recrystalled for 6M.
He was getting out pretty well too.

Somewhere in my papers - I have an article that came out specifically dealing with taking a "Space Patrol" type walkie talkie and placing it on "6 meters" as a QRP rig. I bought a pair to do it - and things got hectic. That became a back burner project. I still have the walkie talkies but have to dig out the paperwork.

Cecil,

Code "isn't" dead "completely", I think we all know that. I believe I am safe in saying that what this guy was getting to was - SC's vigilance to keep insulting No Code Hams OR Ham want to bes. There really IS no reason to keep that up. There is nothing we can do to bring it back - the decision has been made - whether we like it or not. Insults can only help "kill" the hobby.

I've said it before, I'll say it again - if you like it - USE IT. If not - so what!

The horse has been beaten to death - past death, now into the dust. Give it a break. I've blocked all that have supported "his" stupid remarks and argument. It has been going on for at least 6 months. IT IS OVER!

It shouldn't be that big a deal.. I know a lot of the newer ones are basically
one IC with a crystal for the transmitter and an RC tank for the receive, so
you'd have only two things to change.

"Space Patrol" looks good on a QSL card equipment line, but not as good
as "Teenage Mutant Ninja Turtles."

There was a group of us back in Boston in the late 80s doing that a
lot ... we had a big bin of the xtals, and were tuning them up for a
local 6m repeater.

I also had a simplex pair that I used to build a fun 2400 bps packet
rig.

Imminently hackable, and amazingly cheap.

Good memories.

Yeah - the biggest deal of it was changing the crystal. I think the coils
and so on - were pretty much there within reason to oscillate. Been a while
since I read the article though.

This brings to mind... the military has lots of those horrible little
AN/PRT-4A transmitters selling dirt cheap on the surplus market. They
are kind of neat because they have a 455 KHz oscillator to shift the
frequency of the crystal up, allowing you to use the same crystal for
the transmitter as you did for the (seperate) receiver.

NOBODY has documentation on these things. The LOGSA database has them
still listed as unavailable except within the military. Does anyone have
a schematic on these?

As I recall, these were issued in Vietnam for communication within units,
but were mostly famous for drawing fire with their large antennae and
for poor signal quality.

105. Ideal Ham Receiver (cont.)

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-01-10 03:52:53 UTC
From: bcdlr <on30ng@gmail.com>
Message-ID: <1168401169.336442.209860@i39g2000hsf.googlegroups.com>
Source record: 8894

Guys that was a great discussion...
But I still have a question or two. Well actually a lot more than that
but we can't answer them all.

I know I'm not ready to build my own receiver, unless I went the micro
R2 route (I'm going to build one some day).
But that still doesn't solve my need for a ham band(s) receiver - to
use as a receiver and as a necessary piece of test equipment.

I know that the Drake 2b is good. But how easy (and cheap) is it to get
one? Are most "wore" out?
I've heard that a common ailment is that the mechanical filter will be
screwed up.
What are some receivers to look for (don't say the Collins - I don't
have enough money)?
BTW, got the EMRFD for Christmas. I like reading it but I have a lot to
learn...
Thanks,
Dan KB9JLO

And a related question: Folks made a lot of useful comments about
hardware-defined receivers last round, but no one has mentioned
software-defined ones. Are there any SDR's in existence that rival the
best HDRs?

> I know that the Drake 2b is good.
Well, I used to have one and didn't think it was wonderful. The 4C is
good, but now you're talking s-line money. Besides, as a lab instrument
I'd have thought you'd want a receiver with accurate frequency
read-out.

Cheers!
Jim, N5JRS (was K5YUT)

You are never ready to build your own until you bite the bullet and do it

> But that still doesn't solve my need for a ham band(s) receiver - to
> use as a receiver and as a necessary piece of test equipment.

If you want to use the receiver as a piece of test equipment (and a decent receiver can be a really great piece of test equipment) then you want a modern, synthesized, solid-state receiver.

> I know that the Drake 2b is good. But how easy (and cheap) is it to get
> one? Are most "wore" out?

The 2B was a great rig in its time, but that was back in another century. Almost anything recent, even real junk, will be better, and a lot less hassle. Sorry to the guys who wax nostalgic about the old hollow state gear, but get something hollow state if you like to be constantly maintaining it, if you like drifty, unstable, etc. Compared to other stuff AT THE TIME, the Drake was great. But any modern rice box will run circles around it. And rigs from that time are now getting old enough that they will soon need a major overhaul. I you aren't ready to build an R2 then you certainly aren't ready to care for a geriatric radio.

> What are some receivers to look for (don't say the Collins - I don't
> have enough money)?

What do you want to do? If you are going to operate a lot of SSB, then a Collins mechanical filter is almost a requirement, although some of the more recent DSPs might be better they are a slightly different form of operation so I suspect it is a lot personal. If you intend to operate CW, PSK mostly, then the requirements are different.

If you want to use it as test gear, then you want 1) synthesized, 2) DC to daylight -- almost any modern rice box will fit this bill. If you want to use it on 75 meter phone, then you need brick wall filters or a very good DSP (or both). Most modern rigs are triple conversion, with a first IFin the 60 MHz region, second around 10, and third typically 455 kHz. If the receiver you pick isn't VERY recent, look for a rig with the filters in the 455 kHz IF, rather than the 10, and get the filters if you plan to operate on busy phone bands. Interestingly, CW is a lot less demanding, and the other digital modes even less so. The digital modes do require a lot of stability, but on modern rigs that is pretty much a given.

Because of competition, I think you will find a better deal in a transceiver than a receiver. Decent receivers are kind of a specialty item so they tend to be very expensive. Indeed, it seems like you have very low end stuff and very high end stuff, and not a lot in between. The kind of receiver you can buy new for a few hundred bucks isn't going to be useable on the ham bands. On the other hand, if you only want to know whether your homebrew oscillator is on the right planet, then a cheap, synthesized SWL radio will do the trick.

Used prices are really uneven. Some things you can do real well on (browse through the completed auctions on eBay to get a feel for prices), and others people seem to insist on getting new prices for old gear. If you do go with used, it may be the best thing to do is to pick something and get on eBay. The trouble with eBay is that there are enough people that are clueless that things often sell for well more than they are worth. But on the other hand, if you don't let yourself get sucked in, and you are patient, you can often do pretty well. Just be sure you know what you are willing to pay and don't go beyond that, and that you look forward to spending a month or two getting what you want. But real bargains are pretty rare anymore.

A few years ago I would have suggested a hamfest. But most of the hamfests have gotten a lot like eBay. There will be a wide selection at Dayton, but most will be either real junk or overpriced. I guess that is a difference; you don't see a huge amount of old junk on eBay, probably because of the cost and hassle of listing it. You see plenty at hamfests, though.

..

> I've heard that a common ailment is that the mechanical filter will be
> screwed up.

The 2B does not have a mechanical filter so no worries there.

I have a Drake R4A (next generation Drake after the 2B) & it is one of the best receivers I have ever owned [I've owned maybe 50+ medium & high end receivers (Collins, Hammarlund, National, Ten-tec, Yaesu, Kenwood, Swan, Elecraft, etc.) in nearly 50 years of hamming including many of the newer solid state variety].

My R4A doesn't drift (after warm up), excellent audio, pass band tuning, 4 stages of selectivity, AM & product detectors, excellent build quality, extremely reliable & much easier to work on than any of the newer solid state stuff. I paid $140 for mine & nice examples can be had for $150 - $250. The R4, R4A & R4B were similar design & were complete radios out of the box. I've had zero trouble with mine in eight years. The R4C went to crystal filters & is really a much different radio.

I would recommend the R4A's & R4B's as great radios that you will not be dissapointed with for the price.

Look for one that is crystalled up with extra SW freq's & has a clean copper chassis (they are proned to tarnish).

One possibility is http://www.shfmicro.com/ (in USA)

They have only the microwave modules, not the rest. Currently the
website shows only varactor-tuned units, while SOLFAN's are nominally
only mechanically tuned. These are more expensive than the simpler
units more commonly used in door openers or intrusion alarms. Their
stock varies from day to day.

You can build yourself a regen out of literally junk box parts. Direct conversion is a step up and not much harder. The micro R2 is even nicer.

> But that still doesn't solve my need for a ham band(s) receiver - to

If you are looking for "the ultimate receiver as a first step" then homebrewing is NOT for you.

They weren't talking about the 2B then. The 2B is LC filtering throughout. It's nice for the era.

> What are some receivers to look for (don't say the Collins - I don't
> have enough money)?

The new $100 shortwave receivers with a BFO will get CW and SSB OK. Not spectacularly well.

Again, you seem to be struggling with both building your first receiver, and making it the end-all-and-be-all-receiver that you'll never need another one. Those are largely incompatible goals.

You can build yourself a little QRP transceiver for a smallish amount of money. Will probably only cover one band and only the CW section, but that's OK.

You can buy an older all-ham-band (well, pre-WARC) transceiver for circa $100-$200. Might take some tweaking/cleaning, but that'll be good for you to learn. Will do CW and SSB just fine, maybe even AM and FM too if you want that (of very marginal use for most ham activities).

Test equipment on the used market is outrageously cheap. You could set yourself up with a dual-channel scope and a frequency counter for $200 real easy, less if you shop around. This sort of stuff would've been unobtanium to a ham in the 60's or early 70's.

The only mechanical filters that I have seen problems with are the Japanese units that you find in the JRC receivers. There is some sort of foam that deteriorates over the years. I haven't seen a problem with Collins filters. Receivers don't "wear out". With an older receiver, however, it's a good bet that you will have to replace the electrolytic caps and replace all of the carbon composition resistors that have drifted up in value over the years. I took a different approach.....years ago, I also couldn't affort the top end receivers so I learned how to design my own high performance units. It was quite a learning experience, and it is a good way to go. This experience has landed me a few high paying jobs in the field. Give it a try!

All good answers. The main reason I was not going to build a Micro R2 was not the building but the single band.
I wanted something multiple band and as to frequency readout I was thinking of adding a digital dial.
This guy has a neat (and cheap) frequency counter:
http://www.foxdelta.com/products/fc2.htm
And the shipping is only $5 to the US. (Haven't bought from him yet or before, BTW).

Yes, I'm trying to maximize my purchase but I don't expect it to do everything. And I probably should just bite the bullet and build something but I'd like to have something commercial to fall back on.
This maybe werid reasoning but I'm trying to stay away from a transceiver because I don't want the transmitter part. I want to try and build my own transmitters and transceivers.
My first big project plan is to build a BITX20 SSB transceiver. I've had a blast on 20 meter QRP SSB.
I've built an antenna tuner (Hans Summers' site) and I just finished a KD1JV 'Tenna Tuner' - that's how I found out my frequency counter was shot. It was given to me a year or so ago and I had never really used it.
I also have a Softrock 6.x 40 M receiver I just finished but haven't tested yet and a Micro 80 XCVR in the same boat (Micro80 is a Russian Pixie type rig). I also have a AMQRP DDS60 on the bench but haven't started it yet.
I have a RF signal generator (old Heathkit), two o'scopes but both are low bandwidth, one is an old Tektronix solid state 3", 4 MHz BW and the other is some dual trace that is like 5 or 10 MHz - but frankly I don't remember how to use them correctly. I have a DMM, an AADE LC meter (I love this thing), some odds and ends single board stuff I've built.
As one of you said, I need something to listen to the oscillator with... But I'd like just a tad bit more.
Could I really get by with a newer digital dial SW receiver? I thought they were just too wide open on the front end side to be any good at all.
I have been eyeing the Drake R4 series... But that's probably more liquid cash then I have.

Please keep it coming. I learning and asking questions. And some of it is really starting to make sense!! :-)

On the receiver I've put messages on eHam and QRZ for a 'receiver wanted' - I have some P4 class desktop machines I could trade, but I haven't gotten any nibbles at all yet. I've been hesitant to put the

same message on rec.radio.swap due to the volume of traffic there.

But this goes back to the previous thread.

It's far better to build a single band receiver well, and get it
working, than to deal with the issues of multiple bands.

But, that receiver will work all over the place, with some changing
of frequency sensitive circuitry. One of those R2 receivers is
even set up for using modules to change bands.

One of the points of building a receiver that tuned a fixed range,
and then putting converters ahead of it, was that you could build
the main receiver, and use it immediately, and then deal with adding
the other bands.

I've often felt it makes lots of sense to make a good receiver, minus
the frequency selective elements, and then put it into a good box.
Put the "variable oscillator" in a separate box, so you can have a simple
single band VFO to begin with, or even a crystal oscillator for a fixed
frequency, and get the receiver going easily. Then you can work on
the fancier wide range synthesizer, or go through various iterations.
The basic receiver is always available, and so is the fallback variable
oscillator, which is not the case if you need to put the receiver on
the workbench to make some modification.

Now that broadband techniques have come to amateur radio, your "black
box" receiver can keep the frequency selective elements outside the
box. You can play with plug-ins for the desired bands, or something
that switches the LC circuits. Or both, migrating from the simple
to the complicated. You might find that on some bands that are less
important to you, you can get by with a simpler front end filter,
but other bands you want something fancier. If you build a receiver
all in one box, and the ultimate is the end goal, then you don't have
the chance of having the receiver relatively early, and you don't learn
from the experimenting. Plus, your ultimate standards have to be
there across the bands, rather than applied selectiviely.

Ray Moore wrote an artilce in Ham Raido magainze about 1973 or '74 about
receiver design, and showed off what was to him his "ultimate receiver".
But it was a broadcast band receiver, which few of the readership would
be interested in. He was merely using it as an example. His point was

that it's easier to build a really good receiver for a dedicated task
than to build a general purpose receiver that does everything well. He
mentioned that commercial receivers were often a series of tradeoffs because
they needed to provide something to a wide range of buyers, yet then
people are often paying extra for features they will never use.

Starting with a "black box" provides a lot more flexibility than when
putting the frequency selective elements in the box.

It doesn't even have to be the R2. Get a good passive mixer, a decent
SSB-bandwidth 9MHz crystal filter (or build one), and then build up a good
basic receiver that doesn't work without added circuitry. ANd use
that as the "black box".

I'm playing with a homebrewed receiver design and need a LO which
covers 120 to 240 MHz. What's the feasibility of using something
like the MAX4545 to electronically switch the ADF4360-8 VCO's
inductors in order to cover that range? What other approaches
are recommended for a homebrewed digitally controlled LO which
covers that range?

Source record: 8754

John,

We were just having a similar discussion on sci.electronics.design, although it was about switching in capacitors on the ADF4360's L1/L2 pins rather than different inductors. One of the comments -- from Michael Terrel -- was that he's worked on equipment that shorted out inductors at various taps to change ranges. You might get some ideas from reading the discussion: http://groups.google.com/group/sci.electronics.design/browse_thread/thread/af76d133a6069080/f1cdc83a3cf9a3d5

One problem with the ADF4360 is that the DC bias is, of course, ground on both ends of the inductors so the RF swings above and below ground, thus requiring either fancy bias arrangements or devices such as MOSFETs or PIN diodes that will conduct on both cycles with a single-ended control voltage.

Well... the tuning range is 1.2:1, so you'd need at least 4 -- probably 5, more practically -- switched inductors to cover the range. I suspect you could make this work, although the "grounded tapped inductor" approach is probably a little cleaner.

> What other approaches
> are recommended for a homebrewed digitally controlled LO which
> covers that range?

DDS chips! (E.g., AD9858.) The main drawback is that they consume significantly more power than a VCO/PLL combination and none will directly synthesize frequencies much above the low UHF range. But for 120-240MHz on mains-powered equipment, DDS would work well.

Where are you at, Cental Europe? If so, then the front end is too wide open.

If the middle of the US, then there's not much problem. If it becomes a problem, just put an attenuator in front.

The user interface on the new digital dial SW receivers is univerally sucky. They do awfully bad at "tuning around the band looking for a QSO", they are really built around the concept that someone will want to listen to Radio Netherlands at 15735kc and just punch in that number and expect to find it. There might be a tuning dial but it feels more like you're dialing through channels than tuning up and down the bands. The filters are only middlin' for AM, and will be "too wide" for SSB or CW on the ham bands if things are at all crowded. But contrasted with a $250 receiver from the 1960's they have a lot of nice things that were purely pie-in-the-sky back then!

> On the receiver I've put messages on eHam and QRZ for a 'receiver
> wanted' - I have some P4 class desktop machines I could trade, but I

Lots of stuff goes through E-bay. Including the general coverage receivers you seem to desire, for example I got a WJ-8716 (something that was almost entirely out of the reach of a non-millionaire ham in the 70's or 80's) at a tiny tiny fraction of what they originally sell for. Still not "cheap".

If you like CW, I have recently become very enamored of the Heathkit HW-16. There's a lot to be said for simple single-mode limited-bandwidth receivers (or in the case of the HW-12 transceivers). Break-in on the HW-16 with a couple mods is seamless, it's so good that I FEEL like I can hear even when I have the key down.

Spring is coming and there will probably be some hamfests near you. Hamfests tend to be better than say 10 or 15 years ago, when they were all computer junk. Even if you don't buy, you get to see and usually touch the stuff.

Tim.

(ADF4360 L's don't appear accessible?)
Done a bog standard, single transistor Colpitts, that covers 110-220Mhz
using a cheap SMV1255-000 varicap. It's part of a BFO arrangement and
intentionally limited to a 110MHz swing (1.5 to 4.5V) but there's a bit of
steam left in the Varicap and 120-240 seems not unreasonable. Present plan
is to feed the VCO to a LMX2306 synth run as always, by a PIC.
(BFO design started after rooting round for a now unobtanium /100 frequency
count prescaler for another project and noticed the cheap LMX2306 can act as
all things to all men).

What's the power consumption of the VCO? (I'm looking at breaking apart one of those ADF4360's into a separate VCO and PLL, since the 4360's use a *lot* of power, but apparently most of this is tied up in the VCO since you can readily get PLLs that are only a milliamp or two such as your LMX2306...)

2ma at 5V.
It's a 2N3819 fet with 1k5 source. Runs about 300mV rms (or, as this is a
radio group +2.57dBm :) For curiosity, the original fet circuit seemed not
unhappy to be pushed to 500MHz, (on plug in breadboard!).
Noticed the "-7 -8" ADF4360 versions use external Ls. Nice feature (to me)
is that the oscillator is routed internally to drive the DivN counters. At
the moment am using 2 MMC's to give a 1Vrms (apologies, +13dBm) final output
to drive other circuits, ALC and the synth but they burn power like there's
no tomorrow.

That's a Kv of about 36 MHz / V. Naive question ... doesn't a higher
Kv
have the potential for greater noise? What is the effect of a higher
Kv
for the LO VCO on the overall performance of a receiver?

I can understand using a MOSFET to short an inductor at various taps,
however
I don't see how to do that using a PIN diode unless DC blocking
capacitors are
being used between the inductor sections.

You already know the names to look for: Kenwood, Icom,
Yaesu. Most names from the past are either junk by
modern standards, or are expensive collectors items.
You're already on the air, so *talk* to people. Hell, maybe
somebody has an old but still useful radio they're not
using. You'll never know if you don't ask.

There are indeed used professional receivers out there.
You will get an astonishing radio if it has a name on it like
Watkins-Johnson or Harris (two names that have shown
up in this thread), but just because they're less than
they were new doesn't mean they're cheap.

My advice: buy something decent, but don't fret too
much over just what it is. Once you have some
experience with whatever you end up buying, you'll
have a standard for comparison, and will know what
to look for.

You asked about software radios? (I abhor the term
SDR) Buzzword city, ultra-trendy, but I'd be surprised
if 1 ham in 100 really knew how they worked. Get it
right, though, and a software radio can do things no
hardware radio could dream of doing.

Source record: 8762

I looked at this chip some time ago for use as the LO in an HF receiver, and I abandoned it concluding that the noise performance of the VCO is about 20 dB shy of the minimum you need for good HF receiver overload performance ('reciprocal mixing").

As to the VCO tuning range, less is usually better from a noise standpoint, as most varactors don't have very good Q specs and the tighter the varactor is coupled into the overall resonant circuit, the poorer the resonant Q will be. Also, high tuning sensitivity in the VCO makes the oscillator susceptable to modulation from 'junk' on the power supply or the tuning voltage.

Shorting out turns in the resonant inductor as a means of bandswitching isn't so great either, as the shorted turns inductively couple into the resonant circuit as resistors (the resistance of the pin diode or other switching element), lowering the circuit Q and raising the noise of the oscillator.

In general, it's best to band-switch discrete elements such as separate inductors or capacitors and to keep the tuning sensitivity as low as possible in order to provide continuous coverage of a band. If high tuning range is necessary, every attempt should be made to use high Q components and to maintain a high loaded Q in the circuit they're used in. Also, parallelling of varactors has been shown to improve noise performance in wide-range oscillators.

I spent about a day's salary on my WJ-8716. I contrast that with the stuff I had thirty years ago and that's dirt cheap :-). In constant dollars I spent way less on the WJ than on my HW-100 back then.

That said, I have a lot more fun with simple one-mode ham-band-only (or a few-ham-bands or one-ham-band) receivers. The most fun ARE just a step or two removed from the most simple. While the filters on my HW-16 aren't nearly as tight as those on the WJ-8716, the receiver of my HW-16 feels MUCH more like a "window on a slice of the 40M CW band".

> Once you have some

A decent older ham-band transceiver is a fine place to start. Lots of radios from the 80's on are also general-coverage receivers.

My advice is to not only listen and use and look "upscale", but look and try out "downscale" too. Some steps down will be too far (for example, I really do not enjoy direct conversion receivers although I appreciate much of their simplicity) but some other will be "just right".

Tim.

Speaking of the dentist, I visited the dentist yesterday and quizzed the
hygienist
about her glasses with the special lenses mounted out front. She said the
had a
magnification of 2.5 and focus length around 18". Always thought I wanted a
pair of those but 2.5 magnification doesn't seem like enough and she
reported
the cost as $800.00. The dentist had a flip down style that mounted to his
regular
glasses. They cost less but still expensive.

I should have said that the TV camera was mostly for the education and
amusement(?) of the patients, and to allow images to be captured for the
records. For his own use, my dentist has exactly the same kinds of
flip-up compound lenses that give a reasonably magnified view from a
long focal distance. This allows him to sit more upright and avoid back
strain.

Such lenses would be fine for SMD work too, because they would give us
an unobstructed work area, and would reduce back and neck strain for us
too. But as you say, they are low on magnification for our needs, and
very expensive.

People's eyes and preferences vary, so there's no one 'best'
magnification. Personally I find x10 is plenty for SMD, and might even
trade down to x5 for a system that gave me more clear space to wave the
soldering iron... and of course if the price was right.

why not kill 2 birds with one stone?
for about $200.00 u can get the The Electroluminescent Receiver Kit
http://www.pan-tex.net/usr/r/receivers/
its a kit that is designed to be a teaching platform and the pads are large
enough to allow for multiple remove this and try that type mods.
$60.00 of that price is a digital read out.

Hi Joe,

That's some really good information; thanks. One question...

-- If shorting part of an inductor to ground is not that desirable since the PIN diode or other switching device will have finite resistance that'll create noise, isn't there the exact same problem with switching in multiple discrete devices? That the switching device will create a little noise?

---Joel

You got a bargain, and I'm envious. My RF-590 cost more
than my car, though that's not saying much. :-)

I made up for it with my 51J-4 (oops...sorry...it's a Collins!),
which I got for hauling it away.

The HW-16 is one of the great radios, and is an excellent
example of how simple a radio can be, and how well it
can work. I had one for a while, but it kept frying the QSK
switching transistor. :-(

There is an enormous amount of choice out there.
If you (the original poster) come across anything
that looks even remotely useful, grab it.

Sam, I have looked at this receiver a couple of times. The price is quite attractive and I would get to build it to boot. I was just a little skeptical.

Have any of you built one? Does it work well?

It sure looks like a hoot to build and use.

He also has a 'basic' one band receiver kit as well. Don't remember much about it.

Hi group

I am looking for an digital controlled variable gain amplifier with BW > 200MHz.

The amplifier had to have min. 256 steps and should be used in an 50R system therefore impedance match on in- and output are preferred. Max output power 10->20dBm.

I can't find any integrated amplifier there match these requirements. My best choice is AD8368 http://www.analog.com/en/prod/0,,759_787_AD8368%2C00.html and then use a DAC for the digital control.

Have I missed some? Any suggest will be appreciated very much

Thanks in advance

Frank

Are you refering to a strong signal acting as a local oscillator and
when mixed with the phase noise sidebands of the actual local
oscillator
producing results which fall into the IF being used?

The phase noise performance of the ADF4360-8 is listed as -120 dBc/Hz
at 100 kHz offset from carrier. The MAX2620 which I was also
considering
is listed as -110 dBc/Hz at 25 kHz offset from carrier. What did you
end up
using and what are the specs?

139. Software defined radio

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-01-12 05:09:07 UTC
From: numeric <numeric@att.net>
Message-ID: <TJEph.371479$Fi1.104223@bgtnsc05-news.ops.worldnet.att.net>
Source record: 8778

Hi,

My objective is to homebrew a 10khz to 60Mhz software defined radio; one that uses the power of the PC for all modulation and demodulation functions. There are several references for a direct conversion receiver that uses a sample and hold detector or Tayloe detector which seems to provide remarkable performance. If possible I would like to use this detector; it embraces the KISS approach ;-). The problem I find however, is that the detector responds to odd harmonics of the receiving frequency, for a doubly balanced configuration. ;-(As an example, if the receiver is tuned to 10 Mhz, a signal of 30Mhz will also be received. Using Linear Technology LTspice (which is a free spice type simulator) to simulate the detector, the 30Mhz signal is about 10db lower then the 10Mhz desired signal. Looking for 140db or better difference; have a long way to go. Possibly there is an error in the simulation; but I think, unfortunately, it is correct. After all, the switch function is not linear. A Fourier analysis of the switch pulse closely agrees with the detected result; the third harmonic is about 10db lower then fundamental. Does anyone have experience with this type of detector?
Thank You.

The odd harmonic response is typical for switching mixers.

If you want to avoid the odd harmonic response, you should either
filter out before the mixer (e.g. octave filters as used in many
receivers) or use a true linear four quadrant multiplier and feed it
with a pure sinuous local oscillator signal.

However, the noise and distortion performance for a practical linear
four quadrant multiplier may be worse than a switching filter with
octave preselector filtering.

Anyway, some preselector filtering would anyway help the mixer handle
the input signal power and use different attenuators/amplifiers for
different bands. For VLF/LF/MF and lower HF you might need some
attenuation, while for the upper-HF and lower VHF, you might need a
preamplifier.

If direct conversion is used, quite a lot of AF amplification may be
needed, so for the upper bands, it would make sense to use some
RF-amplification ahead of the mixer to distribute the gain between RF
and AF frequencies.

I would suggest using some switchable band filters and a programmable
attenuator if you really want to make the receiver usable and not just
demonstrate that it can tune the specified frequency range :-).

Well I thought it over for a long time as well.....
Then I met David, WN5Y one night on our regular Sunday night Echolink QRP Conference. After a long discussion with him I decided to try one. How well does it work? I'll tell you when I finish it. <g> I am maybe 1/4 of the way through building it.
Is it a fun build, absolutely!

I put the ELR (Electro Luminescent Reciever) assembly on the back burner while I built the m3 digital LCRZ meter http://www.m3electronix.com/lcr.html I figured it would be a handy tool for what ever mod I might wish to try on the ELR unit. So I'm just now getting back to building it.

After building that little LCRZ meter it was a real pleasure to get back to the ELR's large boards and discrete components.

I will say that I have had the occasion to need to ask David a couple of questions along the way and he has always been extremely helpful. He is even open to questions not only about the actual assembly, but is also willing to bounce around queries about modification you might be considering to the unit.

My reason for the choice of the ELR was......
I have a TS430S that I had to send off to get it fixed. Not only did I not have the equipment to fix it, I didn't have the knowledge. About $250.00, 2 months, and 2 trips back to the shop) a return trip for something that wasn't fixed the 1st time around.

After all that, I decided I wanted to learn how to repair what ever rx and tx I bought/built in the future. So I figured if I built it, I just might learn enough along the way to be able to repair it. Since my favorite bands are 40m, 30m, and 17m the ELR was exactly what I wanted.

I'm sure enjoying the build and if I don't like it's performance (which I doubt will be the case) It's designed with the wider pads so that I can play with it and try out this, that, or what ever mods I think could make it better. Ever

tried that on a board with those tiny traces and smd components? I'm not that comfortable with the dead bug or manhattan styled building, maybe later after I begin to understand theory well enough to try something from scratch. And the huge plus that the guy who sells it, encourages me to correspond with him about any mods and he is happy and willing to help me out with them..... Can't beat it as far as I'm concerned. Sorry for rambling on, I'll just close with the comment "try it (I really think) you'll like it"

God Bless,
KA5OAI

Hi, has anyone got a copy of the articles for the Chatterbox Top Band
rig which were published
some years ago in Practical Wireless that they could email to me ?
I had a complete set but lost them due to a disk crash and a corrupt
back-up.
Thanks.

http://www.datasheetarchive.com is another good one. They have 5x more
datasheets than datasheetcatalog even if a bit slower.

Use ADL5330 in combination with a log amp. You can control the ADL5330 with
an ADC.

As extra bonus, you achieve a very nice automatic level control.

I have an old Collins filter made for the R390 series receivers. It is
a cylindrical filter with two pins at each end for connections. I can
hear something rattling around inside this filter as I tilt it from side
to side. Has something deteriorated inside this filter or is this
normal? A later rectangular Collins filter does NOT make this noise.

I don't think a noise is normal.

But, it's always possible that they can be dropped.

The issue Pete is talking about is that those Japanese filters were
made with different materials, and they decay with time.

My filter has never left the original Collins packing (heavy cotton
lining in a large cardboard box) since I got it at a hamfest years ago
(for a project that never happened). I remember the filter seemed ok
when I bought it, and it was NEVER dropped (by me anyway). Years later
when I found it while packing for a move I noticed it developed this
sound when handled.

151. 8877's from storage - "cooking" time?

I have several Eimac 8877's I bought as tested new-equipment pulls around 5 years ago. I tested them again myself at the time, then packed them away.

Here it is 5 years or so later. The question for the panel is how long should I "cook" the filaments before putting plate voltage on?

Thanks,

Jim, N7CXI

I don't think that the tubes will go bad just sitting on the shelf for 5 years, they should work the same as the last time they were used. Having said that, it is always a good idea to wait until the cathode reaches full emission before applying plate voltage and rf drive.

I would think that these tubes reach that point within a minute of applying filament power. You could apply filament power to the tube on the work bench and monitor the tube temperature. With the tube out of the socket and heater power applied via use of heavy clip leads you can feel the base of the tube with your hand and see how long it takes to be able to feel the cathode heat reach the outside of the bottle. (It won't be hot, just luke warm).

155. Help with Stealth Antenna + Counterpoise

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-01-14 08:20:40 UTC
From: NT0Z <kirk@cloudnet.com>
Message-ID: <1168762839.872810.130940@l53g2000cwa.googlegroups.com>
Source record: 8794

Hi, gang:

Just moved into a "Townhouse" and am now stuck with doing the invisible antenna thing... I need some insight. Please read:

My 4-plex has four side-by-side units, each with a ground floor plus an upstairs (plus a hard-to-access upstairs attic space). Looking at things from the backyard, my unit is on the left. After thinking about various solutions for a few months, I decided that the cheap-n-dirty approach was to load up the 75-foot horizontal run of seamless gutter, which runs from east to west. It's about 22 feet above the ground and runs the length of the common roof line. My shack is on the ground floor about 15 feet from the left-hand downspout. With me so far?

To keep things sneaky and to get a better electrical connection to the seamless gutter, I crawled out the bedroom window onto the garage roof...and used a stepladder to climb onto the main roof (yes, at night, of course!). Surviving that, I used an electrical "fish wire" to drop an 18-gauge insulated wire to ground level INSIDE the downspout. Up top, the wire runs horizontally inside the gutter for about 15 feet, where the peak of the garage roof (easy access) puts the gutter at eye level. At the "feed point," about 15 feet into the 75-foot horizontal run, I sanded off the protective coating on the inside of the gutter, drilled a small hole for an 8-32 stainless screw and attached the antenna wire via a soldered lug. I cranked everything down tight and sealed it with silicone for WX protection.

At ground level, the downspout sits a couple of inches above my side door patio slab, so I positioned an empty outdoor hose reel/box to the left of the spout (looks natural and doesn't draw any suspicious glances). Inside the hose box is my SGC autocoupler, which is connected to the wire coming out the downspout (can't be seen without a microscope) and a 1/4-wave counterpoise for each band from 80 through 6 meters. The counterpoise wires, made from 24-gauge enamel-covered motor wire, are bundled together and run around the foundation slab to the north and are hidden by the decorative rock that circles the condo, etc. Also buried in the rock and butted against the slab is a 25-foot run of RG-8X coax, bundled with a length of the same wire I used for the antenna (to power the autocoupler). The downspout is essentially in the center of the building on the north-south axis. The counterpoise goes north and bends around the building to the east while the coax runs to the south and enters the attached garage just above the floor slab. (I converted the attached garage to my office/shack.)

Okay. So I have a 95-foot inverted-L, with 22 feet being vertical, the rest horizontal, worked against a counterpoise system. Not a Steppir

Yagi at 200 feet...and not a horizontal loop at 50 feet...but better than a sharp stick in the eye...

QUESTION 1: The downspout has several angled, press-fit sections and, under these circumstances, I'm always worried about nonlinear rectification. Do I connect the bottom end of the downspout to the antenna wire at the autocoupler level...or do I let the antenna wire float inside the downspout...knowing that they're electrically connected (via press fit junctions) to the seamless gutter up above? If I don't tie in the bottom of the downspout, will it "shield" the wire inside or act "strange" with the autotuner? And what about nonlinear rectification? I can only connect the bottom of the downspout. The upper angles and bends are essentially inaccessible.

QUESTION 2: I can optionally run a second pair of counterpoise wires to the south (40 meters and up - no 80), but the wires will have to be bundled with the RG-8X coax, which runs to the shack. Could there be any potentially bad interaction between the second set of counterpoise wires and the feed line? Coupling? Inductance? RF in the shack hassles? And if that's NOT an issue, is a second set of counterpoise wires going to make a noticeable difference in antenna performance?

I mostly run 100 mW to 10 W, CW and RTTY/PSK. I sort of planned to avoid SSB in case I'm messing with someone's clock radio down at the other end of the building :) I'm in the process of trying to find an IC-703 or an Argonaut of some sort (sold all radios a year ago...long story), but if I can only acquire a 100-W rig, I might be tempted to run 100 W on rare and desperate occasions (to work the Sultan of Bhutan, or whatever :)

SUGGESTIONS? COMMENTS?

All are welcome, of course!

Thanks.

I wasn't concerned about them going bad per se, just tiny bits of gas
released from the inside not getting 'getted' and causing a flashover
when plate voltage is first applied after long-term storage.

It seems that any time I fire up an Eimac ceramic triode after it's been
sitting a long time it flashes over once just to spite me and stress
the supply. Maybe it's just bad luck or other operating practice on my part.

Well effective sometime in Feburary, 2007 you won't need code to get
the highest class of license. See?

My crystal ball saw this a coming.

Whatever you can get to work - just do the best you can. I was in the same situation in a condo,
although I was on the 3rd floor. I tried loading the gutters, but got very poor performance. I ended
up with just a 30' run of 26ga enameled wire run from the bedroom window out to the eaves under
the balcony, and that worked great. But I was running a Drake C-Line (this was in the year 2000)
and had lots of power. I worked all over the US and some DX on 40 and 20, with a Kenwood
TS-180 manual tuner. QRP would have been a very different story. I only run CW, so didn't
have any experience with SSB. I'm sure I was lighting up something in the building, but never got
complaints (of course, no one knew I had an antenna!) and only ran late at night on 40 and in the
middle of the day (when folks typically aren't watching TV or even at home).

If you get a good sharp dip at resonance with your tuner, you will probably not have a lot of
interference problems. But if the tuning is 'mushy' and very low Q, watch out! You're probably
not getting out, and just swamping the house with RF. Be sure to employ a good LP filter as well.

I wouldn't expect much QRP performance, especially at 100 MW!

Just give it a go and see what happens.

Hey, OM:

If I remember correctly, in the late '80s / early '90s, Phillips made an in-dash AM/FM/SWL/Cassette car radio. Always wanted one. I'm sure there are still a few lurking out there.

Hey...just checked. Here's a Sony car stereo that covers SWL bands, too!

See it at:

www.shortwavestore.com/sws/product.php?productid=595&cat=42&page=1

Nifty!

Jim, I would suggest a bit more than a minute or two.. You may want to pop that question over on rec.radio.amateur.amps and get the group opinion... I would suggest a 24 hour filament preheat after long storage... There is no more effort in letting it cook 24 hours than for 3 minutes...
I have no direct experience with the 8877 but I do speak 4cx800... The majority of the amp builders getter new tubes with filament heat only for up to 24 hours before applying HV.... One of the failings of hams is that we seem to think that turning on the filament is wearing out the tube... Whereas the broadcast industry turns the filaments on and leaves them on because they know what wears out the tubes is cycling the filament from cold to hot over and over...

I just finished bringing a 3CX1200D7 back to full output with a controlled filament over voltage for 6.5 minutes with no HV applied...

cheers ... denny / k8do

They used to be popular in Europe where SW broadcasts were commonly used
as sources of news and entertainment. There may be many models still
available there. The problem with using them in the U.S. is that the AM tuner
will not work properly as the stations are 9kHz apart instead of 10kHxz,
and the FM stations will sound different.

I doubt that anyone driving in a car would notice the difference (it's
due to how the high freqencie sounds are processed) and the tuners may
be set or modifed to 10kHz spacing, or tune in 1KHz intervals.

73,

Geoff.

This is much too vague to give a specific answer. Are you looking for an UPS from a specific company? Do you intend to build one? What type of output do you need? What load will it drive? How long a time? Have you tried a search engine to find the info?

It's also important to bring heaters/filaments of large tubes up to
power SLOWLY!. In the old days, they'd use a variac (with a large
knob!) and slowly bring the voltage up so the heater/filament wouldn't
be shocked by the sudden inrush of current. In a dual 4-400A amp I
built years ago I just put a large resistor in series with the primary
of the filament transformer and shorted it out with a relay after 15
seconds delay. (Used a transistor and an RC circuit to control the
relay). After the the filament was on full power another circuit on the
relay removed an interlock on the relay controlling the HV power supply.
There was also a resistor in series with the plate transformer that was
shorted out by a relay (the coil of that relay in parallel with the
primary of the plate transformer). This limited the inrush current to

the filter capacitors to protect them and the rectifier diodes.
There were TWO power switches, on for filament and one for plate, plate
power could NOT be applied until the filaments had full power.

4-400A's being directly heated, come up to power rather quickly.

As for the flash over in those ceramic metal tubes, maybe some trace
radioactive elements in the ceramic has something to do with this?
If you don't believe it, bring a Geiger counter near the tube!

>
>As for the flash over in those ceramic metal tubes, maybe some trace
>radioactive elements in the ceramic has something to do with this?

No, it's just the result of very slow outgassing from the metal and ceramics.

To handle this problem, all vacuum tubes are constructed with some kind of 'getter', a chemically activated surface that combines with stray gas molecules and keeps the vacuum clean. In small glass tubes, the getter is the silvery metal film (usually barium) deposited on the glass, but such metals are too volatile for use in transmitting tubes.

The getter used in transmitting tubes is a metal such as zirconium or tantalum, which needs to be hot in order to function. In large glass tubes the main getter is typically the dull grey coating on the outside of the anode, which is intended to run very hot. In addition, there are often secondary getters in cooler locations such as the grid and heater/filament structures. However, the anode of a metal/ceramic tube is always quite cool, so the main getter has to be in the hottest place available, typically on top of the cathode post.

All this means that transmitting rubes need to be *used* in order to keep the vacuum clean. Tubes that haven't been used for a while may need to be fired up with heater/filament only, to give the getter a chance to function before high voltage is applied. Cooling is also required, of course. How long this takes will depend on the individual tube, but 24 hours is usually enough to reduce the risk of high-voltage flashover.

Just to be clear, a leaky seal is a completely different problem. Outgassing is typically worst with brand-new tubes, but will eventually settle down. In contrast, a leaky seal is continuous. Although the getter may be able to handle a very tiny leak for a while, the leak will eventually win.

To whom this may concern,

The ARRL has now entered a new facet for technology here on Google Groups. In fact it has entered it twice. The ARRL and The American Radio Relay League are just two more google groups which have popped up in the last several weeks which are both itching to gain members. The ARRL groups are both set for Amateur Radio members who wish to join in on the action with real pros on familiar terriotry. Memebership unlike the real thing is free on both counts and they provide the same services that the real ARRL provides. Keep in mind that they are both brand new but soon they will be as advanced as the real thing and maybe better.

73 and thnaks for listening,

I want to build a power meter for the hf bands that has maybe three scales: something like 0 to 1 watt, 1 to 5 watts and 5 to 25 watts. I had one I built for 1-5 watts one time and remember it was easy measuring across a voltage divider resistance network. Can't find the schematic rite now.
I enjoy working qrp and it would be a useful asset in the shack.
I also might want to add a circuit to it for attenuator since my rig only goes down to 5 watts.
thanks and 73

Well, I think I'm just going to go with a modern, portable SWL receiver for now. There are several very interesting models that are quite cheap. New prices are about $150 for the newest and best of them.

I appreciate all the input and encouragement. I built my first 'Manhatten' constructed circuit this week - a VFO for the BITX20 transceiver. The good news it oscillates, the bad news is not at the right frequency or the right spread but I've got an online buddy helping me out and if nothing, I got off of dead center. I'm just excited that it worked at all - AND - that I understand most of it and how it works. I'm pretty sure I will understand it all before I'm finished.

If you're intersted the radios I'm looking at are the Eton E5, Sony ICF-SW7600G & GR, Degen/Kaito DE-1103 and a couple of other oddballs. Hopefully I can snag one off of eBay.

Thanks again.

186. MI5 Persecution: Dirk Gently on the Toronto Case (328)

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-01-18 22:19:55 UTC
From: MI5Victim@mi5.gov.uk
Message-ID: <m07001823141759@4ax.com>
Source record: 8824
Cross-posted to: microsoft.public.es.windowsxp,rec.radio.amateur.homebrew,microsoft.public.it.winserver,fr.rec.photo.materiel,microsoft.public.fr.windowsxp

Dirk was on the West Coast when he got the call. An old friend at the Toronto police department thought he would like to fly up and take a look at a homicide which had occurred the previous evening. He decided to skip the last day at the World Holistics conference and take the next plane out of San Francisco.

The flight was bad; Dirk had been hit on the back of the head by the Newspaper trolley, the drinks trolley, the dinner trolley and now the gift trolley. When the hostesses weren't trying to tear his arm off they pestered him to stop leaning into the aisle - ignoring the fact that the guy next to him was taking up one and a half seats. Air Canada used to be the flight which was so good you just didn't wanna get off - on this occasion Dirk would be glad to see the back of the plane and the over sized alternative comedian wedged into the window seat.

After breathing in a couple of lungfulls of crisp Canadian air Dirk took a taxi into town. There was a small group of demonstrators outside the MacDonalds and the taxi driver insisted on stopping on the opposite side of the street. "Don't Eat Meat" the placards read and the demonstrators chanted. A couple of policemen where stopping the crowd entering the restaurant itself - one held up his arm and challenged Dirk. A wave of the fax he had been sent and the policeman pushed open the door.

There were few customers in the restaurant. Not surprising really with a demonstration going on outside, half the dining area roped off with tape and a dead body seated at one of the tables. "Mr Gently sir" the officer in charge called out as he peeled one end of the tape off a column "We were told not to touch anything til" you got here".

The body of the man slumped awkwardly in a chair. Then even a dead body would start getting uncomfortable in a MacDonalds chair after twenty minutes - and this one had been there for at least eighteen hours. Two back legs and the tail of a cat hung out of the man's gaping mouth. Dirk turned to the officer, "I suppose you are going to tell me this is the darndest thing you ever saw?"

�Ain�t this the darnd...�. The officer seemed annoyed that Dirk had second guessed him. �We�re removing the body in a few minutes, so if you can get through as quick as possible�

�Many people eat cats in fast food restaurants?� Dirk asked and without waiting for an answer leant over the table to pick up an untouched burger. �And what�s this?� he asked waving it in front of the officers face.

�It�s a Vedgie Burger� The waitress, who was cleaning one of the adjacent tables, shouted across. She walked over to Dirk. �We started doing them because of that lot out there� she nodded towards the protesters who were pressing there faces against the windows �They�re called Linda McCartney Vedgie burgers - ever heard of them?�

Dirk suddenly felt faint, perhaps a combination of hunger and jet lag. �This is deja vu all over again� he thought to himself. He glanced at policemen - at the badge on his shoulder �OPD� but this wasn�t Ontario this was Toronto. OPD - Officially Pronounced Dead. It dawned on Dirk what was happening, he knew what he would see if he looked out of the window. Sure enough, there it was, the Volkswagen Beetle parked across the road - number plate 28IF - 28 IF Paul McCartney had lived. And amongst the lyrics of the song blaring out into the restaurant he could pick out the words �I buried Paul�. Now it was though Dirk was viewing the whole scene though a TV screen. This was conspiracy. Not -a- conspiracy, or -the- conspiracy, but just plain conspiracy.

�You look faint - are you OK mister? The waitress asked.

Dirk shook his head �Probably a bit hungry� Then to economise on dialogue took out a pack of cigarettes and held it out towards the girl. She was about to take one but Dirk snatched the pack away, held it up to his mouth and drew out two cigarettes. He lit both then passed one of them to the girl. It was the closest he had come to a sexual encounter in three months.

�Want a Burger?� the waitress asked.

Dirk looked down at the Vedgie Burger on the table. �No thanks - just a plate of fries�

The waitress walked away and Dirk looked around the room. Apart from a family seated in the far corner there was only one other person in the restaurant - and he wasn�t eating. The guy was about mid twenties and had straggling, shoulder length hair. On the table in front of him were lots of pieces of paper cut into squares. Every so often he would pick up a camcorder and pan it around the room and then, when he was finished, speak into a microphone which was attached to a

tape recorder. Dirk walked over to where the man was sitting.

The small pieces of paper had paragraphs of text written on them and were stuck to the top of table with blobs of mustard. Lines had been drawn, some solid some dotted, on the table top with a marker pen. The lines ran from one piece of paper to another.

“What are the lines for?” Dirk asked, realising straight away that “What the hell are you doing?” would be more appropriate.

“You see” The man replied nervously “The dotted lines are weak links and the solid lines are strong links. The dotted lines are things which are happening in the rest of the world and the solid lines are things which are happening to me. Now you see I draw over a dotted line, replacing it with a solid line, when I can link something back to me. Like this” The pen squeaked over the Formica and before Dirk could interrupt the man added. “You see I lost my short term memory and, as a consequence have a very short attention span. I write down, record and film everything then put it all together later”

“So” Dirk interrupted. “You filmed what happened here?”

“Yes, yes, it’s here on this tape” The man pushed the cassette across the table. On the label the words “Grassy Knoll” had been crossed through and replaced with “MacDonalds”.

Suddenly the man sprung from his seat. Dirk turned and saw that the body was being removed on a stretcher. As it passed the man picked a small object off the edge of the stretcher itself. “This is important” he said, laying a blood stained bullet on one of the small pieces of paper on the table.

Suddenly the room was filled with a deafening throbbing sound as a Black Helicopter landed in the street outside. Two men in United Nations uniforms got out and collected the stretcher. Back at the table the long haired man was replacing all the dotted lines with solid ones. Dirk panicked and began to walk backwards at some speed. Barging through the swing doors he stumbled into the kitchen, tripped and felt himself sink slowly into a large vat.

“The guys fallen into the batter” Dick heard someone shout before he sunk below the surface. He came to sitting in a chair with the batter solidifying all over his body. He surveyed the room through two eye-holes someone had cut. Suddenly the chair on which he was sitting was picked up carried through the restaurant and out of the building. As the chair was being lifted and put into the back of a van, Dirk caught a glimpse of the waitress following him. “Your fries mister, your

plate o...�.

The doors of the van shut and Dirk tried desperately to steady himself as it sped across town. Eventually the doors flew open and Dirk was flung into the road at which point the solidified batter shattered and set him free. Standing up he found himself outside the international departures terminal of Toronto airport.

In the departure lounge Dirk had time to reflect on the day�s events. He had got caught up in the conspiracy theories and the haphazard welding together of pieces of irrelevant information. It was time to catch the person who was operating the bizarre cognitive engine which appeared in front of him like a fairground mirror, distorting any flaw it could find in his own, fragile, map of the real world.

Dirk leant into the aisle of the plane as it took off for London. The oversized person next to him swung his arms violently as he complained about every thing from the supper in a plastic tray to the state of British politics. With a shaven head and a badly fitting suit the man looked as though he could have worked behind the reception desk of the Kremlin. However when he spoke he did so in a Liverpudlian accent. �Me I blame the Con-serv-a-tive government, me. The Tour-rees. That-cher. Me. They need a good kicking� He jerked his feet forward and struck the seat in front with his Doc Martins. �With these. Me Doc Martins. Doctor Martin�s, Doctor Martin�s, Doctor Martin�s Booots!� The phrase was now being sung over and over again as the man writhed in his seat and clicked his fingers.

Dirk looked down at the boots and thought of the reaction most people used to deal with the paranoids at the end of the wire. A nice quick kick. �Oi nutter - get some therapy�. This is the easy way out and perhaps the safest. After all there you are sat, alone, in front of the screen. No body language between you some paranoid. No way of telling if he really is some gibbering psycho. Look at it too long and you be drawn in. Fall into the tangled database of weird links with him. Who knows he may be watching you, reassembling and linking your experiences with his. How sure are you of you own cognitive threads. After all cognition is only a bug fix for a neurological system which was designed in a hurry - it�s abused by everyone from politicians to advertisers. If people really can convince each other that a bottle of washing up liquid is as exciting as an orgasm using just television God knows what they can do with a computer. Better to avoid the risk. A swift kick. After all if you�re Homophobic you put the boot in because you are scared of any ambiguity in your own sexuality

- why not be Nutterphobic as well.

```
Although Dirk would have liked to devoted time to tracking
the culprit down he decided to let it rest. The Internet
changed over the next twenty odd years. A lot of the people
who used it went out and got lives. And those who already
had lives burnt them away. The number of users had dwindled
after someone had invented a C++ program, with truth as a
variable, to deal handle politics and government. Dirk had
already retired from finding old ladies cats with the help of
obscure science when he got another call from Toronto.
```

It was 4th March 2025 when he booked onto the Air Canada flight from Heathrow. The silver haired woman in the seat next to him painted bright red lipstick around her mouth. &#65533;Of course it was no surprise to be offered the job after Claire Raynor retired&#65533; she sneered&#65533; After all I used to be a psychiatric nurse... Now if Blokes had periods they would understand...&#65533;

By chance the taxi ride to Toronto mental hospital took him past the MacDonalds - where the whole thing had started. Of course it was barely recognisable having become a Church Of Scientology Vedgie Bar. Police in riot gear kept the two sets of demonstrators apart. Dirk didn&#65533;t really know what to expect when he got to the hospital. The girl at the reception desk directed him to a row of chairs in a wide well lit corridor. There was a strong smell of disinfectant, the furniture and the carpets were immaculately clean and behind the rows of teak veneer doors the &#65533;nutters&#65533; were all safely locked away. For some reason Dirk started thinking about CompuServe forums.

A tall blond woman in a white coat approached. &#65533;Mr Gentle, I assume&#65533;

&#65533;Yes&#65533; Dirk replied shaking her by the hand. &#65533;You&#65533;re the nurse who...&#65533;

&#65533;Doctor&#65533; She interrupted, &#65533;Doctor Killfile&#65533; She led Dirk across the corridor towards one of the doors then stopped with her hand resting on the handle. &#65533;Now you know about this person don&#65533;t you?&#65533; and after Dirk nodded she continued &#65533;Don&#65533;t tell him anything about yourself - don&#65533;t let him get into you head. If he does he&#65533;ll screw it up&#65533;

The door opened to reveal a frail man sitting in from of a TV screen. He had a keyboard on his lap and next to the television was a computer screen. Dirk glanced at the walls of the room and remembered that his settee at home need upholstering. The nurse left the room and the man looked up &#65533;So you come to my daughters wedding and ask me to kill a man&#65533; he said in

a dry cackling voice. &#65533;Look&#65533; he continued, pointing at the screen, &#65533;I know that man. They&#65533;re talking about me now - listen&#65533;. The man stared at Dirk. &#65533;What&#65533;s your name? Are you one of my friends from the Internet? - Are the lambs still screaming Dirk?&#65533;

Dirk, at first recoiled in horror, then felt a sense of anti climax. So this is what they hyped up to superstar status on the back of their own fears of madness. Dirk was reminded of the film &#65533;A day on The Beach&#65533; where a submarine had set off to search a post nuclear World to track down a signal coming from a remote military base - only to find it was being sent by a Coke bottle half balanced on a Morse tapper. Outside the room the nurse waited for him. Because his nicotine craving had returned - and to avoid an awkward piece of dialogue - Dirk turned to her and asked . &#65533;Patch?&#65533;

Dirk took two nicotine patches from his wallet the first of which he stuck onto the inside of his arm. Stepping closer to Doctor Killfile he opened her white coat and slid his hand into the opening at the front of her dress. He pressed the patch onto her leg as close to the top of her inner thigh as he dare. She took a deep breath and then slowly breathed out. &#65533;What Bogart could have done with these things&#65533; Dirk thought to himself.

&#65533;Is he crazy?&#65533; Dirk asked tilting his head back to towards the door.

&#65533;Who knows&#65533; Doctor Killfile replied &#65533;We let him type away. He sees something on the TV in the morning and it keeps him busy all day. What he types doesn&#65533;t go anywhere it just stays on a mainframe in the basement. It can be read by anyone else in the building but that&#65533;s it. We got them all in here conspiracy theorists, racists, nationalists. They&#65533;ve created a world within a world really...&#65533; Her voice trailed away and she stared down the corridor for a while then added &#65533;So long are two things are different neither will come to be in the other and so become at once both one and two.&#65533;

Dirk gave her a puzzled look &#65533;You mean their brains are fried?&#65533;

&#65533;Fried?&#65533; Killfile smiled at Dirk &#65533;No that was Plato&#65533;. Then the smile fell from her face. &#65533;You must remember, mister, plate o...&#65533;

Mike Corley FAQ
version 0.1
first edition 5th May 1996
last updated 5th May 1996
Iain L M Hotchkies iain@XXXXX.demon.co.uk

Mike Corley is a 'net personality' who has been active on the following newsgroups (uk.misc,uk.legal,uk.politics,uk.media,soc.culture.british) since....? Well, at least as far back as the summer of 1995.

He posts long tracts, the tone of which approximates that which one might expect from a reasonably intelligent paranoid schizophrenic.

No details are known of Mike's 'real' personal life or background. Once would presume that he came from a reasonable family and was reasonably well educated before the first symptoms of schizophrenia began.

Schizophrenia: Clinical features
(from the Oxford Textbook of Psychiatry, 2nd Edition)

The acute syndrome

Some of the main clinical features are illustrated by a short description of a patient. A previously healthy 20-year-old male student had been behaving in an increasingly odd way. At times he appeared angry and told his friends that he was being persecuted; at other times he was seen to be laughing to himself for no apparent reason. For several months he had seemed increasingly preoccupied with his own thoughts. His academic work had deteriorated. When interviewed, he was restless and awkward. He described hearing voices commenting on his actions and abusing him. He said he believed that the police had conspired with his university teachers to harm his brain with poisonous gases and take away his thoughts. He also believed that other people could read his thoughts.

This case history illustrates the following common features of acute schizophrenia: prominent persecutory ideas with accompanying hallucinations; gradual social withdrawal and impaired performance

at work; and the odd idea that other people can read one's thoughts.

In appearance and behaviour some patients with acute schizophrenia are entirely normal. Others seem awkward in their social behaviour, preoccupied and withdrawn, or otherwise odd. Some patients smile or laugh without obvious reason. Some appear to be constantly perplexed. Some are restless and noisy, or show sudden and unexpected changes of behaviour. Others retire from company, spending a long time in their rooms, perhaps lying immobile on the bed apparently preoccupied in thought.

The speech often reflects an underlying thought disorder. In the early stages, there is vagueness in the patient's talk that makes it difficult to grasp his meaning. Some patients have difficulty in dealing with abstract ideas (a phenomenon called concrete thinking). Other patients become preoccupied with vague pseudoscientific or mystical ideas.

When the disturbance is more severe two characteristic kinds of abnormality may occur. Disorders of the stream of thought include pressure of thought, poverty of thought, and thought blocking. Thought withdrawal (the conviction that one's thoughts have been taken away) is sometimes classified as a disorder of the stream of thought, but it is more usefully considered as a form of delusion.

Loosening of association denotes a lack of connection between ideas. This may be detected in illogical thinking (knight's move) or talking past the point (Vorbeireden). In the severest form of loosening the structure and coherence of thinking is lost, so that utterances are jumbled (word salad or verbigeration). Some patients use ordinary words in unusual ways (paraphrasias or metonyms), and a few coin new words (neologisms).

Abnormalities of mood are common, and of three main kinds. First, there may be sustained abnormalities of mood such as anxiety, depression, irritability, or euphoria. Secondly, there may be blunting of affect, sometimes known as flattening of affect. Essentially this is sustained emotional indifference or diminution of emotional response. Thirdly, there is incongruity of affect. Here the emotion is not necessarily diminished, but it is not in keeping with the mood that would ordinarily be expected. For example, a patient may laugh when told about a bereavement. This third abnormality is often said to be highly characteristic of schizophrenia, but different interviewers often disagree about its presence.

Auditory hallucinations are among the most frequent symptoms. They may take the form of noises, music, single words, brief phrases, or whole conversations. They may be unobtrusive or so severe as to cause great distress. Some voices seem to give commands to the patient. Some patients hear their own thoughts apparently spoken out loud either as they think them (Gedankenlautwerden) or immediately

afterwards (echo de la pensee). Some voices seem to discuss the patient in the third person. Others comment on his actions. As described later, these last three symptoms have particular diagnostic value.

Visual hallucinations are less frequent and usually occur with other kinds of hallucination. Tactile, olfactory, gustatory, and somatic hallucinations are reported by some patients; they are often interpreted in a delusional way, for example hallucinatory sensations in the lower abdomen are attributed to unwanted sexual interference by a persecutor.

Delusions are characteristic. Primary delusions are infrequent, and difficult to identify with certainty. Delusions may originate against a background of so-called primary delusional mood - Wahnstimmung. Persecutory delusions are common, but not specific to schizophrenia. Less common but of greater diagnostic value are delusions of reference and of control, and delusions about the possession of thought. The latter are delusions that thoughts are being inserted into or withdrawn from one's mind, or broadcast to other people.

In acute schizophrenia orientation is normal. Impairment of attention and concentration is common, and may produce apparent difficulties in remembering, though memory is not impaired. So-called experiences result from illness, but usually ascribe them to the malevolent actions of other people. This lack of insight is often accompanied by unwillingness to accept treatment.

Schizophrenic patients do not necessarily experience all these symptoms. The clinical picture is variable, as described later in this chapter. The table below lists the most frequent symptoms found in one large survey.

The most frequent symptoms of acute schizophrenia (World Health Organization 1973)

Symptom Frequency (%)

Lack of insight 97
Auditory hallucinations 74
Ideas of reference 70
Suspiciousness 66
Flatness of affect 66
Voices speaking to the patient 65
Delusional mood 64
Delusions of persecution 64
Thought alienation 52
Thoughts spoken aloud 50

Various theories exist about Mike Corley:

1) he exists and is disturbed and has net access and for reasons uncertain spams a selected number of newsgroups on a regular basis - if you are reading this FAQ then you will almost certainly have seen one of his posts.

2) Mike Corley is a 'virtual schizophrenic'. Mike displays the relevant features so well that some people think he may be a construction of one or more people with intimate knowledge of mental illness and the mentally ill. Perhaps they wish to monitor the effects on the internet of the posts of a schizophrenic. Moving into X-Files territory a bit, ourselves, here.

Mike's posts attract different responses:

1) cruel, humourous, dismissive posts from those who've seen his posts many times and have become generally irritated by his behaviour while accepting that he probably has a mental illness.

2) posts from Corley-newbies - those who have come across relateviely few of Mike's posts. These may be humorouous or disbelieving.

3) posts from people who have been sucked in (for one reason or another) into Mike's Wild & Wacky World (TM)

That's enough for now.

Persecuted by the Security Service

Since June 1990 the British security service MI5 has waged a campaign of harassment against a UK citizen,
through the broadcast and print media, verbal abuse at work, and molestation in public and during travel.

Despite widespread knowledge of the campaign in the UK and discussion of its characteristics on Usenet for
over three years, it continues today both in Britain and North America. Its cause and basis is xenophobia
on the basis of the genetic accident of mental illness, coupled with discrimination against an inferior
"foreigner" whom they condemn as "not up to British Standards".

If this is your first visit to this site, please read the FAQ first. Feel free to contact the author with
any questions.

Frequently Asked Questions article outlines the parameters of the persecution. Who is involved, and why?
What technical and social means do they employ? What response have I made, and why has their campaign yet
to be exposed?

The UK Security Services which are believed to be behind it all. Domestic security is the province of MI5
while the secret intelligence service MI6 combats foes (and its former employees) on foreign shores.

Usenet archive chronicling the (sometimes very enthusiastic) exchanges which have taken place on UK-local
newsgroups since May 1995. Make your mark on the continuing discussion!

Believe it or not, a few items of evidence have been recorded. Although none of them is particularly
conclusive, by presenting them I hope to explain what I understand from some television and radio programmes.
Most of the "clinching" material was aired in 1990-92, and no recordings exist now, which is quite unfortunate.

My complaints to the BBC and MI5 (via the Security Service Tribunal and Interception of Communications Tribunal),
and their response to my challenges, are recorded here. Basically they deny everything, they have put their

denials (mostly - Buerk and Lewis refused) in writing, and I don't believe them. Part of the website also
documents media coverage of my campaign to expose the persecution.

Faxed articles to, and responses from British organisations including Parliament and UK media. Over 24,259 faxes
in all were sent from 1998 to 2000. Their aim was to boot discussion of the persecution into the public domain,
and that aim was not accomplished.

Thanks, Ian. That's a very clear and concise description of the issue.

This may be overkill, but since it costs nothing I'm thinking of four six-hour cycles, allowing the tube to cool to room temp or so between cycles.

Since you're here, Ian, I'll slip in an unrelated question. What do you think about using regulated DC for the heater on an 8877 ? I ask because I'm thinking of using a couple of spare controller I/O pins and a home-made R2R network to ramp up a series-pass regulator as part of the overall controller startup.

On the other hand, I suppose a relay and appropriate power resistors would be simpler... ;-)

Thanks,
Jim, N7CXI

20,000 Reward Offered to Expose the Conspiracy

I am making a pledge for information directly leading to the exposing of the "BBC Newscaster
Conspiracy". The exposing would specifically need to lead to a legally binding admission from Martyn Lewis
or Michael Buerk of the BBC they they were watching me through the TV set.

I would be happy (delighted, in fact) to pay GBP 20,000 sterling in reward for the above admission.

So if you use your linear often you only need to heat treat the tubes
once, on installation.

193. Re: Where to buy large area copper clad boards in Canada?

Newsgroup: rec.radio.amateur.homebrew

Define "large". Which part of Canada?

In Toronto I'd start with Active Surplus. In Vancouver, RP.

On some if not most european continental amateur radio fleamarkets
cut-offs up to 1x1 ft are often sold by weight.
I have a healthy stock enabling me to also homebrew enclosures.

Is this material not available from surplus traders frequenting North
American hamfests & fleamarkets ?

Frank KN6WH / GM0CSZ

That's the sort of answer I would have given, but I wondered if it
was a trick question.

"Large area" suggests something really big, but if someone isn't
familiar with what is available, then "large" might mean something
more than a few inches.

In 35 years, I've never bought blank circuit board new. Starting
with wretched board that cracked when you cut it and the copper came
off when you soldered to it (but it was "surplus" and cheap at
Etco Electronics back then), and then buying it at hamfests, and
then the remaining old school electronic store here in Montreal (Addison
Electronics), blank circuit board of all kinds of thickness and sizes
and single or double sided has always been readily available.

You're right, it can usually be had so cheap that it is a great thing
to use for enclosures. Unlike plastic, it's can provide shielding, but
it's also a lot easier to work than equivalent thickness metal. I've
been known to strip off the copper and use the bare board when I need

to make up some mechanical gadget, it being so easy to work with.

Addison often has board that has been drilled for some production work, but not etched (or even had resist applied), which is even cheaper. I can cut around it for small pieces, or if I'm just using the board for soldering to, the holes aren't even noticed.

For the original poster, the Radio Amateurs of Canada have a website at http://www.rac.ca and they keep a list of upcoming hamfests, so it's easy to watch for one coming up nearby. Though, it's really the off season and I doubt there will be many until the spring.

What would be the reason for dividing the 24 hours into four parts (bearing in mind that the 24h is already little more than a guess)? Also note that the tube must be cooled anyway, to avoid overheating of the base seal. 5V at 10.5A is a lot of heat input, and all of it must be removed somehow.

>Since you're here, Ian, I'll slip in an unrelated question. What do you

>
>On the other hand, I suppose a relay and appropriate power resistors
>would be simpler... ;-)
>
There are two separate issues there: the need for a regulated heater supply; and the need for a slow ramped startup.

The need for a regulated heater supply depends on the regulation of your mains voltage. Eimac specify +/- 5%, so if your mains regulation is worse than that, a separately regulated supply could be worthwhile. Mostly you need to prevent the heater voltage dropping too low, because electron emission from a chilled cathode may not be able to deal with the peak anode current.

If you ever plan to use the amplifier from a Field Day generator, then the answer changes to a definite "yes". Otherwise you can get a nasty scenario where you switch to TX, the increased demand pulls the generator voltage down, and the heater voltage along with it... and then you're trying to pull peak anode current from a chilled cathode. With two or three stations sharing the same generator, there will frequently be a "double low" or "triple low" when stations are transmitting at the same time. You can't do much about the effects on anode voltages in this FD situation, but you can prevent unnecessary stress on the cathodes by regulating the heater voltages.

As it happens, the 8877 has a 5.0V heater, and low-cost 5V switch-mode supplies are very readily available. A PC power supply would do, but is

much larger than needed for an 8877 (10.5A). Nominal 5V power supplies can generally be modified for other voltages in the 5-6V region by jimmying the master voltage divider. Switching noise should not be an issue if you choose a supply that is shielded, and filtered at both input and output.

But this raises an issue related to your second question. It is not normally necessary to avoid prevent inrush current surges with *indirectly* heated tubes such as the 8877... BUT... a voltage-regulated heater supply MUST be modified to prevent it from driving a very large current into the low resistance of a cold heater at startup. I haven't tried this personally, but some people have created a ramped startup by simply adding a large electrolytic capacitor across the right half of the master voltage divider (you can check this using a 6V light bulb).

By the way, I learned a lot of this stuff by reading the mail on the AMPS list over the years (http://lists.contesting.com/mailman/listinfo/Amps). There are also searchable archives.

ok, I was not precise. I am an amateur. What I am looking for is
getting copper board for less than what digikey is selling.

When I say large, 12"x12" is large enough, even smaller. I think the
keyword is "cheap", not "large".

I used to buy (in Eorope) large sheets (by weight, i.e. cheap) and then
cut the sizes I wanted. (where large is defined as approx 1m x 1m).
Here in Canada, I could not google up anything similar.

p.s. I am in Ottawa, ON

Thank you!

Digikey's prices are good on a lot of things, copperclad isn't one of them. Almost anyplace would be cheaper. If you don't have decent hamfests up there, you can find plenty on the other side of the border.

I generally pick up most of mine at the Findlay, Ohio fest, a bit of a hike for you, and probably not a large enough fest to make it worth the trip. I go every other year and a two year supply generally costs me around twenty bucks.

Dayton is worth the trip, and if you are a builder, then the QRP conference FDIM is well worth the trip all by itself. For copperclad, though, you need to be quick at Dayton. Even though there is an amazing amount of stuff there, the decent deals on copperclad are often all gone by the middle of the day Friday.

On the subject of copper clad what is the best way to cut it into the sizes one need? I would assume using it for constructing boxes would be pretty time consuming using hacksaw and files. Short of a full size bench saw is there anyother lower cost/ smaller size electric saw that would work well with CC ?

Thanks Larry

A bench shear is a wonderful thing for cutting copperclad. I have a relatively inexpensive small brake and shear from Northern Industrial Supply that also comes in handy for making boxes. It is a little small for some things, but I just plain don't have the space for a full size model. Even fairly large shears aren't all that expensive if you have the space.

204. FT-1000D internal coax plug

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-01-20 05:08:23 UTC
From: ka9s3@comcast.net
Message-ID: <1169269703.441226.143100@l53g2000cwa.googlegroups.com>
Source record: 8842
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment

I want to make a modification to my FT-1000D that involves bringing the QSK switched receive coax lead to the back panel (adding a RCA phono jack). I want to unplug the inter-board coax cable that runs from J7208 (on the LPF unit) to J1005 (on the RF unit) and leave the original coax in place. I want to make my own cable that runs from J7208 to the new RCA jack on the back panel. I could just cut the original coax and use it, but I want the option to back out of this modification if I don't like it.

I have coax cable I can use. I need the tiny coax plug that goes on the end of the cable. The plug is a crimp-on style and very small. It is keyed and only fits into the circuit board jack in one orientation. The circuit board jack (which I don't need) sticks up off of the board at a 45-degree angle.

I thought I would just order a spare cable from YAESU and use it for my modification. I contacted YAESU. They don't have a part number for the cable. They would have to build one from scratch at the factory in Japan and were unwilling to do this.

I have been searching catalogs but not finding the plug I need to be compatible with the jack on the LPF board.

Does anyone know what type of connectors these are and where I can get some?

Thanks - Jeff - KA9S

To cut fibreglass or phenolic copperclad boards I use a carpet knife
(repaceable Stanley type) After carefully scoring (deeply) along a steel
ruler it breaks very neatly . Finish with a file or amaril paper .

Although I have not seen the plug, it sounds similar to what Ten Tec used in
the Omni VI series and probably others. Ten Tec is very helpful, you might
give them a call.

I have several dbm modules, most with sma but some with bnc and most have the labels worn off. I suspect one might be HF and the rest microwave. I have a Watkins Johnson with a blown mixer and need to replace it. I've ordered a Minicircuits SRA-3H but no word as yet. How would I go about testing these to find out if they're any good and good for VLF to 30 MHz? It would be too hard to substitute them as the space is limited and I don't want to risk buggering something else up. On some I'll have to determine, in, out, osc and that mya be a chore if the unit bad.. Any tips on how to determine the leads and test for performance appreciated.
tnx

Browsers usually only remember history of URL's directly typed in. If a
site is reached via a link the browser won't save the history of it.

What browser planet did you get that nugget from? Most browsers
(ever Exploder) remember every site you visit for as many days as
you set.

Charlie.

The '3 series of mixer from MCL are good down to about 25kHz. Good performance can be expected another octave down from there. Does the synthesizer in your WJ receiver provide +17dBm of LO injection? The mixer you ordered is a Level 17 mixer. The MCL website does have the pinout for this device. I like the '3 series, since the SSB conversion loss is in the 4.75dB range vs other series, which have conversion loss in the 6.5dB range. This is a very good mixer. Now, which mixer is your WJ receiver using? Some of the WJ units used a mixer that had a pinout similar to MCL's GRA-3.

I bought this 8718 as a parts unit and now have it working, somewhat. The can that covers the mixer is gone, someone was messing inside but the manual has it as M9D made by WJ I think. I wish I could find a schematic on it becasue it might be repairable, kind of small but I've looked at it with my 6-50 stereo zoom microscope and might be able to fix it if I knew what diodes it used. Without a diagram I'm afraid that I might bugger something. When I attach a 5 foot piece of wire to one the diodes the radio picks up all the AM stations and no problem with WWV or 20 meters..Haven't done any other testing. I was told that the SRA-3H was a good sub and took their word for it. If something else is closer or better I'd sure like to know. I can't find any reference in the manual to the output level of the first LO but it covers ~ 43 to 73 MHz.

213. Bad Colpitts osc Waveform

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-01-21 00:40:30 UTC
From: amdx <amdx@knology.net>
Message-ID: <43f29$45b2b6a1$45011502$12674@KNOLOGY.NET>
Source record: 8601

Hi All,
Please see pictures and diagram at ABSE.

I duplicated a circuit for someone because they got a bad
output waveform.
Well I did too.
Capacitor = air variable set at 365pf
inductor = 41uh aircore
With freq set at 1.3Mhz I have the voltages as follows;
Collector - 11.8vdc
Base - 3.1vac riding on top of 3.2vdc
Emitter - 2.5vac riding on top of 3.9vdc (Don't be critical, it's not ac
if it sets on dc)

As I shift up in freq at about 2.7Mhz the voltages jump.

Capacitor = air variable set at 40pf
inductor = 41uh aircore
Freq = 3.7Mhz
Collector - 11.8vdc
Base - 10vac riding on top of 1.8vdc
emitter - 1.1vac riding on top of 9vdc

The base waveform in both senerios is much more sinewave (ish) than the
output.

Any ideas how to get a decent waveform? The next step will be a buffer,
but...

Note; original schematic used a crystal, I substituted the LC. Could this
be the
cause of the distortion?

Thanks, Mike

I checked my WJ databook, and I was wrong about that GRA-3 pinout. The SRA-3H does have the same pinout as the M9D, so it is a drop-in replacement. The original mixer is indeed a Level 20 mixer, which means that you LO injection level is +20dBm. It is rated at 6.5dB conversion loss over the 2 to 400MHz range. This means that it won't have the greatest performance in the LW/MW range.
The IP3 is +30dBm, which is a bit better than the SRA-3H.
A better mixer to use would be the MCL TAK-3H. This mixer has an IP3 of +29dBm and a conversion loss in the 4.77dB range. The TAK-3H is rated down to 40kHz. I used to use the TAK-3H as a drop-in replacement for the 1st mixer when I upgraded KWM-380s.
You can't go wrong with this mixer. The original diodes are probably HP1N5711 hot-carrier diodes. I would throw in the TAK-3H.....performance will be enhanced over the original design. You will have a 1.7dB improvement in the noise figure, and to do that without the need for RF amplification ahead of this stage is a bonus.

I don't know if I would agree with that. The 8877 has a 5v 10A heater. While that is 'only' 50 watts of power, it is a resistance of only 1/2 ohm WHEN HOT. When cold, the heater might have a resistance of only .05 ohms, and represent an inrush of almost 100 AMPS. While an indirectly heated cathode's heater element is somewhat protected against thermal shock by the surrounding cathode, at this current level some inrush delay might still be a good idea with such an expensive tube. It also might prevent premature burnout of the filament transformer!

Well, offhand, I don't like the way the base is biased... That
transistor will be clamping on the negative voltage swing which probably
answers why the waveform is so poor.

If you make a voltage divider for the base voltage, the transistor
oscillato ought to give a better waveform.

Perhaps something like 27K from +12 VDC to the basen, and 9.1 K from base
to ground.

This should improve the waveform shape....

The only reason for splitting up the 24 hours into cycles was to
thermal-cycle the relevant tube components. It may be mythology, but
I've heard that the hot/cold cycle "shock" will help release any gas
molecules that may be right at the surface. Even if it is mythology, it
seemed the kind that's relatively harmless when translated to
superstitious action. ;-)

Thanks for your comments on the heater supply. I'll chew on that a while
and see if any implementation ideas come up.

I'd test them with a couple of suitable signal generators, and a simple
filter on the mixer output. You should see if they are are still
working and get a feel for their performance.

This circuit doesn't look very good from any standpoint other than (possibly) being cheap. It's questionable for a crystal oscillator in anything but el-cheapo consumer electronics, and just bad for a coil & cap oscillator. Most of the points have been mentioned already; I'll just reiterate them with my own spin:

The base biasing is _wrong_. Biasing a bipolar transistor that way will make it extremely sensitive to device and temperature variations. You can somewhat get away with it in an oscillator because you're working with a class C device, so the emitter voltage will rise with rising oscillation strength, making sort of a poor-man's AGC (with emphasis on the 'poor').

Bias should be with a resistive divider on the base, adjusted so that the oscillator starts up nicely yet keeps the emitter voltage from rising to within 1 volt or so of the collector voltage.

The ratio of C1 and C2 is also extreme. I'm surprised that you get oscillation at all. The rule of thumb for a Colpitts is to choose feedback caps with reactances at frequency of around 150 ohms. You can improve the waveform (and load the circuit less) by retaining the 1nF "C2", increasing the capacitive reactance to the emitter with a smaller cap in series to the transistor emitter, and retaining the take-off point at the hot end of C2.

I wouldn't build an oscillator like this without following it with at least one buffer stage designed to minimize the effect of following circuits on the oscillator, and following _that_ with an amplifier stage. You're not building tube equipment, transistors don't cost that much -- go ahead and use a few!

If you don't get a book dedicated to RF circuit design (like Hayward's "Experimental Methods") then at least get a copy of the ARRL handbook and follow the guidelines there. You can go wrong with them, but not too much.

Thanks Tim,

>The base biasing is _wrong_.
I tried Jim's voltage divider biasing arrangement, it didn't help the
waveform, but I understand
the temperature sensitivity of the original.

>The ratio of C1 and C2 is also extreme.
This circuit and all values was taken from Joseph Carr's "Secrets of RF
Design"
I did replace the crystal with the LC. He calls this a 1 to 20 Mhz crystal
osc.

>You can improve the waveform (and load the circuit less) by retaining the
>1nF "C2", increasing the capacitive reactance to the emitter with a smaller
>cap in series to the transistor emitter, and retaining the take-off point
>at the hot end of C2.
Sorry, I don't know if I understand what you suggest; Do you mean to say connect
a small cap from the connection point of C1 and C2 and the connection point of the
emitter and R2?

I have seen several Colpitts osc. that have an inductor in series with the emitter resistor,
would that be useful? If so what value for 3 to 6 Mhz.

On another note; I noticed the base waveform is pretty good. Has anyone seen a design that
lightly couples a signal from the base to maybe a FET and buffers it. Just a thought!

Thanks,
Mike

The collector waveform will always be much richer in harmonics than the base waveform. If you want to multiply up this is Good. If you see some random circuit in a handbook keep in mind that they may very well have intended it to be used for multiplying up 2x, 3x, 4x, etc. so the bias etc. may have been chosen just to make the waveform at the collector look un-sine-ish!

There are numerous oscillators that take the output signal from a tapped-down tank if they want a minimum of harmonic content. Tapping down helps minimize the effect of loading on the tank Q, but taking the signal from there will have at least some effect on oscillator stability. Another place that might like look slightly nicer from a waveform view (and may be lower impedance) is the emitter. And there exists oscillators that put a smallish resistor in series with the tank - the resistor value is chosen small to not degrade the tank Q very much, and the small voltage across the resistor looks very sine-wavish.

Tim.

Nice products. I still have a couple of your VOR testers that I mainly used to verify my radios worked before departing the Bahamas on an international IFR flight plan. After the plane had set a couple of weeks it was nice to know the Navs were working before getting airborne.

I probably ought to EBAY them. I have not used either for over 20 years and will have no use in the future!

You might check www.nogaqrp.org and look at "Kits" and the NoGaWaTT.
It can be built for the 0-6 Watt range, or milliWatts. It is pretty
accurate.

Also, if you are an ARRL member, go to the ARRL site and look for the
article on the log power meter. Near the end of the article, there is
information on an accessory higher power attenuator good for up to 100
Watts that you may be able to adapt to output to a 0-5 Watt range
meter (rather than the much lower power range of the log power meter,
a test instrument which only reads to about 5 milliWatts, or 7 dBm).

If the voltages suddenly jump with frequency change then this is a sign of instability. Not seen the circus digramus confusicus, but if it is a colpits then reduce the gain by adjusting the ratio of the two divider capacitors. I assume, of course, that you have adequately decoupled the supply line, and that there is no inductive coupling/feedback.

Instability causes eratic frequency and/or severe distortion. In particularly bad conditions it can cause unwanted visitors (CBers, neighbours, DTI, etc.).

Mike

Let me suggest the ARRL publications CD. You get QST, QEX and NCD. I like them because I can then toss the paper QST copies, saving space, but better yet, you can print out the schematics, PCB layouts, etc, mark them up, cut them up, without guilt. The recent years are all PDF so you can sut the parts lists and paste them into a spreadsheet as you go collecting parts, pick out tables of interest and concentrate them into a reference binder, etc.

..

239. Re: Converting AM Car Radio to Shortwave UPDATE

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-01-25 07:48:14 UTC
From: AussieDrifter <Mark__Rutherford@hotmail.com>
Message-ID: <ep9nc1skm1@news-02.connect.com.au>
Source record: 8627

Guys,

The Sony XR-5100 in car cassette AM/FM/SW radio is a great little performer, and its mounted in my Pajero 4x4. I ordered my from the Shortwave Store and picked it up when I was in Hawaii for my Wedding and Honey Money 2 year ago (Else delivery cost to Australia was not going to be worth it). Whenever I head out camping or just day trip I always have a Shortwave Radio with me, without worrying about packing a portable shortwave.

The only downside is the radio beeps when you press the tunning buttons. So If you know what freq you want then you hold the tuning button until you get there else you let it scan and stop on freq whichever you desire. BTW it does have a remote control which I love as when I'm sitting on the back tail gate / boot I can easy control the radio and volume from back there :)

To make it more effective I carry two bits of random wire BLUEY 1 - 10foot blue light wire cable for short stops by the side of the road and BLUEY 2 - a 100m drum of light wire cable for when I have time to run a good bit of length.

I would highly recommend this radio, but if you can unlike mine do not run it though a electric car antenna, however that said, when the car is stationary and engine turned off the electric antenna is fine, and even better when extended with a bit of wire :)

Regards
Mark

Damm! I dumped a few years worth, when I bought the ARRL CD. Now I keep up by buying the annual CD from ARRL, in each Feb, or thereabouts. It has QEX, QST and NCJ on it.

The CQ one is also pretty good, even although it has some articles withheld because of copyright arguments, mainly fractal antennas.

243. MI5 Persecution: Toronto Freenet supports free speech (328)

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-01-25 19:38:06 UTC
From: MI5Victim@mi5.gov.uk
Message-ID: <m07002520322977@4ax.com>
Source record: 8631
Cross-posted to: microsoft.public.es.windowsxp,rec.radio.amateur.homebrew,microsoft.public.it.winserver,fr.rec.photo.materiel,microsoft.public.fr.windowsxp

Despite an orchestrated campaign of attempted censorship by UK-resident newsgroup readers, TFN did not bow
to demands for a suppression of freedom of speech. TFN general policy on the matter is as follows;

Draft Policy on Account Deactivations due to News Group Postings
==========

News group postings occasionally take the form of a message which goes against the "topic" of the conference.
For example, a derogatory message about Canadians in the soc.culture.canada.

Members of such news groups then may send a message to the system administrators asking that a user's account
be terminated because of such posting.

The Toronto Free-Net Board of Directors has taken the position that the only postings that will get a person's
account terminated is material that is illegal under Canadian law. Otherwise, the Toronto Free-Net will not
take any action.

Freenet Executive Director Mike Anderson had this to say regarding the continued attempts of a minority of usenet
participants to have my account on his system deactivated;

The TFN's policy is not to take action against members unless they contravene the Criminal Code of Canada, or
engage in practices such as forgery, attacks against other computer systems or mailbombing.

Mr. Corley, while possibly being very annoying, has not contravened the TFN's policies. The TFN believes strongly
in freedom of expression, while recognizing that the price for such freedom may be a high signal-to-noise ratio in Usenet.

If Mr. Corley breaks the law, we will take action -- until then, he has the same rights as any TFN member to post
to Usenet newsgroups. Actions such as mailbombing the TFN in protest will be met by strong complaints to the
originating site's postmaster. The best defense against unwanted postings may be simply be to ignore them and deny
the poster an audience.

TFN Executive Director Toronto, Ont CANADA

Personally, I find it gratifying that my contributions to usenet discussion are recognized as being conducive
to a high signal-to-noise ratio by their quality and thoughtfulness.

Newsgroups: alt.conspiracy
Subject: BBC's Hidden Shame

Remember the two-way televisions in George Orwell's 1984?
The ones which watched you back? Which you could never get
rid of, only the sound could be turned down?

Well the country which brought Orwell into the world has
made his nightmare follow into the world after him.
Since 1990 the British have been waging war against one of
their own citizens using surveillance to invade privacy
and a campaign of abuse in the transmitted media in
their efforts to humiliate their "victim".

And the most remarkable thing about it is that what they
do is not even illegal - the UK has no laws to protect
the privacy of its citizens, nor does it proscribe
harassment or abuse except in the case of racial abuse.

A lot of people in England know this to be going on,
yet so far they have maintained perfect "omerta";
not a sound, not a squeak has escaped into the English
press, and for all the covert harassment absolutely
nothing has come out into the public domain.

Have the British gone mad? I think we should be told.

From: "Mr.B" <dgb01@stir.ac.uk>
Newsgroups: alt.conspiracy
Subject: Re: BBC's Hidden Shame
Date: Mon May 8 05:32:13 1995

Mmmm.

Who, exactly is this victim you're talking about?

First up, Britain or the UK (not 'England' - England is
a part of Britain, like Kansas is a part of the USA) does
have laws that protect the individual from harassement -
you can't just threaten people willy nilly. There are laws
against that. And if someone lies about you in the press
or tv then you have recourse to libel/slander etc. laws.

True, Britain has no 'privacy' laws as such, but isn't that
a good thing? As of this moment, the govt. are considering
a privacy law, but it is unlikely to succeed. Why? Because any
such law would benefit the priviledged and those in power.
Privacy laws, while supposedly protecting the individual, help
those in power hide their mistakes/scandals. They stop the press
etc. investigating. Privacy laws are undemocratic - they prevent
the people from keeping an eye on govt.

And stop looking for some kinda conspiracy in the British
press. It's hardly perfect, but your notion that they don't
cover/campaign against press legislation, harrassment,
discrimination, human rights etc. is plain wrong. You've never
seen a British paper in yr life.

You clearly have a specific case/individual in mind. Speak up!
The thought police aren't coming round just yet.

Douglas.

Date: Mon May 8 19:21:28 1995
Newsgroups: alt.conspiracy
Subject: Re: BBC's Hidden Shame

Confession time - the victim is/was me (except my name isn't
Corley, but that's irrelevant). What happened was not threats;
just invasion of privacy, in a partiicularly flagrant and
shocking way, in a way which most people would consider to
constitute harassment.

You know there's a particular category of person with mental
illness to whom TV and radio "talk", ie they feel the broadcast
is directed at them in particular? This happpened to me,
quite some time ago in the UK (I'm originally from London,
so I've seen plenty of British media print and other).
They invaded my home with their bugs, they repeated what I
was saying in the privacy of my home, and they laughed that it
was "so funny", that I was impotent and could not even communicate
what was going on. Who did this? Our friends on BBC television,
our friends in ITN, last but not least our friends in Capital
Radio in London and on Radio 1.

How did they do this? I'll give you an example. About a year ago,
I was listening to Chris Tarrant (Capital Radio DJ among other
pursuits) on his radio morning show, when he said, talking about
someone he didn't identify, "you know this bloke? he says we're
trying to kill him. We should be done for attempted manslaughter"
which mirrored something I had said a day or two before
(I'm not paranoid, honest!). Now that got broadcast to the whole
of London - if any recordings are kept of the shows then it'll be
there.

You mean the category where they think that everyone is after them ? that
one ? So lets get this straight you know you are paranoid and you think
that they are out to get you ? Uh huh, try putting the two together and
see what you come up with.

>quite some time ago in the UK (I'm originally from London

>Radio in London and on Radio 1.

Oh yeah, I can see it now. All of them banding together, in a united effort against one man. So ITN, the BBC, and Capital all decide to sit round the table and they come up with idea of breaking into someones house, putting bugs everywhere, listening in to his conversation, and shoving it out on the news everyday. This someone has nothing to do with politics, or business, or entertainment, just an ordinary Joe Bloggs who seems to be extremely paranoid.

Have some sense, grow up and smell reality. What you are talking about would take loads of planning, tens of thousands of pounds and lots of people involved in the planning, execution and maintenance of it. You must have a very high opinion of yourself to think you are worth it.

>How did they do this? I'll give you an example. About a year ago,
>I was listening to Chris Tarrant (Capital Radio DJ among other

>there.

Of course you are not paranoid, just slightly mad. Did you ever look for the bugs in your house ? If not, why not ? I mean if I thought that was happening to me, I'd search the place from top to bottom, I mean I live there I would know if anything was out of place. If I was really paranoid, whoops I mean suspicious, I would call in one of those bug detection teams which have those machines that pick up the transmitted radio waves. This reminds me of BUGS, that new programme on BBC1 on saturdays which is all about this kind of stuff, but, shown as a drama / thriller. I suppose thats based on you as well is it ?

>is that there is a conspiracy in Britain, that it encompasses the
>broadcast media, and there is no way of breaking the conspiracy.
>The people who are involved in it will not open up.

What a load of jolly hollyhocks, I would say something else but, apparently students are not allowed to swear on newsgroups in case it damages the reputation of the university or some such jolly hollyhocks.

This guy is extremely paranoid to suggest that the entire British media is after him in such a big way. He gives no real reason as to why they are after him, just that he suffers/suffered from a slight mental

disorder, could it be paranoia perhaps ?? No surely not.

I put it to the house that he has never recovered from this mental disorder, lets come out with it and call it paranoia, and thinks everyone is after him. Remember just because you aren't paranoid, doesn't mean they aren't after you.

This guy has a serious problem to suggest that the media would go to such lengths just to single out and ridicule one person. I mean apart from anything else, we (the listening masses) wouldn't be interested unless it concerned the royal family, politicians or showbiz personalities. e.g. the camillagate tapes. I would think that almost everyone, no matter how much they went on about infringements of privacy read the transcripts with interest. I really don't think that Joe Bloggs ordinary guy or paranoid nutter would have the same appeal. Well actually I dunno. :)

Regards,

Paul.

That is what happens in big cities. Hell, it scared me to death when I first
started working in Manchester. People keep talking to me on the streets,
even if its just to say hello, and I've no idea who they are. This happens
to most people, don't worry about it.

>>paranoid, whoops I mean suspicious, I would call in one of those bug
>>detection teams which have those machines that pick up the transmitted

>That's exactly what we did. We went to a competent, professional detective
>agency in London, paid them over 400 quid to debug our house. They found

Doesn't this suggest to you that there are, in fact, no bugs to be found?

>Over Easter I went to the police in London, telling them basically
>what I've posted here. I don't think you'll be surprised to learn
>that I didn't get very far; they asked "why would they be doing this to
>you in particular?" and the answer "they are because they are" doesn't
>go very far.

Exactly. All you have offered so far as proof of your harrassment by these
people is:

1) Someone on radio said something that you had recently said
and
2) People on the streets seem to recognise you.

These are both perfectly normal occurences and happen to lots of people every
day so it is unsurprising that people here, and the police, are not taking
you seriously.

Trying to always keep an open mind about things I would say that one of three
things is likely.

Either there is a lot more to this that you are not telling us, or you are messing about or you have some genuine delusions. I'd like to think that in two of the three cases you would find some real support here, but it seems unlikely I'm afraid.

Claire

>started working in Manchester. People keep talking to me on the streets,
>even if its just to say hello, and I've no idea who they are. This happens
>to most people, don't worry about it.

The key is the pattern, or a change in the pattern. I've lived in London almost all my life, and just walking around the streets, I never got hassled by anybody. All of a sudden, people start harassing you, throwing abuse at you, behaving as if they know you personally, as if they've seen you before somewhere. I read in the papers that this happens to Colin Stagg and people like that Eastenders actress, but they've had their picture in the paperes, so that is understandable. In a couple of cases people have even known my name - when I was in London over Easter I was walking down Shaftesbury avenue in the West End when somebody (no idea who they were, just some bloke with his girlfriend) called me by name - quite clearly, and my name is distinctive. This also happened once about four 1/2 years ago, onn the tube - some blokes I had never seen started chanting my name and a term of abuse.

It's the pattern which convinces me there's something to it - and would convince any impartial abserver who could see things tyhrough my eyes.

>Doesn't this suggest to you that there are, in fact, no bugs to be found?

There's a little story behjjind this. First iof all, in 1992 I worked for a company where the people made clear they knew what was going on, first of all directly (the very first evening I was there I went out to the pub with them and the Technical Directpor said to another guy, "is this the bloke who's been on TV?" "yeah, I think so") and also indirectly, by rep[peating stuff I was saying at home in London and in my rented accomodation there (I moved several times in the course of 1992 and they followed me each time). Now, if "they" (the buggers)

knew their bugs could be found easily, they wouldn;'t be keen to make
their existence known, would they?

Also, in summer 1992 I went on a trip abroad to Europe by coach, and
on the way out there were a couple a little younger than myself on the coach
a bloke and hius girlfriend. He said things about some bloke who was
never named, who sounded exactly like me - and he made explicitly
clear that our house was bugged, and that a neighrbours house was
bugged (and at work they'd been rep[earting what was said at the
neighbours, so this looks like independent corroboration).
They also said stuff like "at school he was always really streesed,
they found someone from his school and he was a real psycho"
and that "he was in a B&B for one night and they got him", dead right
again, I had been in B&B for once night a few days before this trip
and weatching the news again got a reaction from the newsreader.

Subject: Re: BBC's Hidden Shame

>:some pirate radio station in London in 1991, started listening to
>
>Conclusive proof if ever I heard it.
>
>Of course you were the only person in the office in the whole of Britain

Yeah, but this is the point. Each incident is easily and automatically
deniable along the lines you're taking. But when this happens every
time, and when you get independent corroboration from other people,
then there's no escaping it. For example, immediately after I lost
my job in 91 I went into the local garage to get some work done on the
car, and one of the blokes there said to the other, "so what do you
think of it then? it's getting killed on the radio isn't it"
Now again, you look at that and no proff; you can ask them what they're
referring to and they can say they're talking about something else.

>I know you may be a little paranoid, but I suggest you sit down
>and work out rationally what possible reason anyone off television,
>or radio would have for listening to your conversations. After all
>it must be hard enough to present a show to millions of people
>without the added burden of watching and listening to a single
>person and slipping their phrases into the programme.

These presenters are clever people. They wouldn't be presenters
if they weren't - they're easily capable of reacting to an individual
in this way.

What possible reason? I guess because they think it's amusing to do
so. They know that if you ever tell anybody, without being able to
show any evidence, then the reaction you'll get from just about
anybody will be the one you're showing now.

I realize there are loads of people in England and elsewhere with
the sort of thoughts I've described in these postings; and almost
all impartial observers would say that nothing other than an
go after their private conversations (if they did it to me then I can
do it to them, it's a questions of technical competence and money).
If you were lucky, you might be able to entrap them into admission.
You could of course harass or threaten them back (any coppers reading
this?) but that would be illegal and might get a result quite

different to the one you're trying to achieve. Of course, it might
come out of its own accord given time - if so many people know, if
they have an escape valve in their "subtext" through the media,
will it not cease to be at a covert level, given time? Surely it
is in my interest for it to become overt, since the transgressions
at this time are on their side and not on mine?

Thoughts? There must be some way of breaking the secrecy. This
isn't the first time in human history that a conspiracy has taken
place on this scale, but the truth tends to out. The situation
now is they think they';re "winning" hence have little stimulus
to change the rules - if they started seeing themselves "losing"
things could change drastically.

Mike, if that is your name,

I'm going to try to rationalise what you're telling us. I can think of three
possible explanations for what you are experiencing.

One is that there _is_ a conspiracy against you. As a previous writer said,
though, a lot of these programmes are taped, so it really isn't possible in
some of the cases you've named. Further, why were no bugs found in your
house? Finally, unless you are a political figure or someone else in the
public eye, why would anyone bother? People like me (and I assume you) are
small fry; our contribution to society is likely to be minor. Why would
anyone spend so much money and effort on you?

Another possibility is that you are developing some kind of paranoia. There's
no stigma attached to this; we're all paranoid to some extent, although
perhaps not to the extent that a doctor would call us paranoid. I think
paranoia is quite a straightforward explanation here - you really do believe
that all these things are aimed at you; you see people everywhere trying to
get at you. Logic suggests that this cannot really be the case.

The third possibility is that not even you really believe any of this, and
that this is a "troll". I'm not sure I believe this possibility, but it's
possible.

Anyway, if you want to be sure that you're _not_ going mad, I'd go and see
your G.P. if I were you. If you don't trust him/her, why not see someone
recommended by a person you can trust? If you don't trust anyone any more,
don't you think it's time you got help?

For a troll, the posts are remarkably well-informed on paranoid
behaviour.. you'd need to be one, or be reasonably well-informed on the
subject to sustain the tale... which lead me to my theory...*ahem*...:

An extension to possibility 3 (Number 3.5, perhaps?) is that the original
poster may be somehting like a psychology student writing a term paper
on the net community's reactions to this tale. (Now, there's paranoia
for you! Not only are they listening to/watching us, they're writing
reports about us too...:-)

More likely, though, is that the poster is genuinely in need of professional
help (he has intimated as much, himself) and, as such, he should be encouraged
to seek it.

>reply? Something more constructive than those silly little
>jokes about paranoia perhaps? Like what objectively can you do
>to break the conspiracy open, if one exists :-) ? If somebody
>did it to you, what would you do?

But we've *done* that. I certainly have at least. Way back when you
originally started posting and your posts were neither tediously repetitve
nor stupidly long.

But whenever anyone makes any good suggestions you ignore them and start
posting from the begining again. You don't want us to help you - so what do
you want? If you really wanted help you would listen to peoples suggestions
and respond to them. Is this just an attention thing?
But I'll try again, because I'm a fool like that.

>o Tell people about it, go to the police / legal services
> Done that; those around me either don't believe me, or they
>"sort of" believe but can't do anything about it. As for going
>to the police; I did, over Easter. Discouraging. They must be
>familiar with the occasional person walking into a station with
>this sort of story. "If a psychiatrist says you're imagining
>it, then that's what it is".

You haven't yet given any examples of anything concrete to suggest that this
is really happening to you. This, I would imagine, will be the stumbling
block for the police. How can they possibly help you when your only evidence
is a jumbled mess of TV presenters saying things that could be construed as
answers to your comments and the 'feeling' that people are talking about you
and watching you?

I seem to recall that last time this was being discussed someone asked if you
had been to see a psychiatrist about this - after all if this is really
happening then you have can only benefit from being given a clean bill of
health. I don't recall an answer.

> I also went to a firm of solicitors; again, very
>discouraging. Put bluntly, they can't deal with cases where the
>perpetrators aren't well-defined and the existence of the crime

>itself is unprovable.

Well how could they? Who would you sue? The country?

>o so if that option is out, what's left? well, there's the
>"do nothing" option. To some extent this option works. They've
>spent a lot of money and ultimately achieved nothing except to
>force me out of the country - which has been an own goal for
>them, since now they can't do what they were doing in the UK.
>Expenditure of further resources would feed the pockets of
>their greedy contractors, but is a waste of money as far as the
>employing organization is concerned.

So you are no longer in the uk? And this is not happening anymore?

Then let it go. Just leave it alone and get on with your life. Its just not worth it. There is nothing you can do to prove that this happened whether it did or did not. So forget it. Go and explore the net - when people aren't spamming it with useless repetitve posts there's a lot of interesting and worthwhile things out there to see and do. Likewise real life (I'm told *&).

>completely conventional, I have a good academic and work
>record. Until all this started, I had no mental health
>problems; the diagnosis of illness was only after 2 1/2 years
>of abuse. If they did this to me, they could do this to
>absolutely any British citizen. If this stuff gets out, it
>won't be me that has to worry - it'll be them. They take a
>normal person, lie about him, demonise him, try to force him
>into killing himself - and this is in a country where the rule
>of law applies?

If this gets out then *that* will be the time to bring your claims to the foreground.

The only thing ruining your life right now is you, Mike. And the only thing that will make your life any better now is also you. So go and make your life better and show them that they failed.

Claire

==========

>But we've *done* that. I certainly have at least. Way back when you
>originally started posting and your posts were neither tediously repetitve
>nor stupidly long.

Once again we're running into a brick wall. The reason I started posting was because I couldn't figure out a way out of the situation, and thought that saying it out into the open would provide a catalyst for one of those "in the know" (there are plenty in this category, and it's a fair bet that some of them are reading this) to speak up.

It hasn't worked, yet. A little more aggressive shit-stirring (excuse expletive) might do the trick. Perhaps Usenet posting is the wrong arena for this sort of activity; although obviously it does have the advantage of rapid feedback.

Thing is, for people to open up, you would have to provide them with a reason why it would be in their interest to do so. There's no obvious way of doing that; to get thinking people to incriminate themselves when they're safe in denying all knowledge is not a trick I can figure out how to do.

>But whenever anyone makes any good suggestions you ignore them and start
>posting from the begining again. You don't want us to help you - so what do
>you want? If you really wanted help you would listen to peoples suggestions
>and respond to them. Is this just an attention thing?
>But I'll try again, because I'm a fool like that.

A "good" suggestion would be one which had the effect of halting the persecution, which so far hasn't happened. If you make a "good" suggestion then damn right I'll stop posting - because then I won't have to.

>You haven't yet given any examples of anything concrete to suggest that this
>is really happening to you. This, I would imagine, will be the stumbling
>block for the police. How can they possibly help you when your only evidence
>is a jumbled mess of TV presenters saying things that could be construed as
>answers to your comments and the 'feeling' that people are talking about you
>and watching you?

Because, as said previously, concrete proof does not exist. If it existed then I wouldn't be talking to you - if it could be proved, or if those doing it could be found, they wouldn't be able to continue.

What's happened is all conversation. You can't prove conversation, not without a tape recorder, and even then you would have to prove that what they meant corresponded to what you understood.

The psychopath who manages the Applics group at my previous employers played little word games, not only with me but with at least one other person in the group; words which rhyme with swear words, words which are ambiguous, eg "bent", words which rhyme with wank, "sheet" rhymes with shit, end (how was your weak end? being the standard salutation on a Monday morning). Sounds childish, most people would easily tell him to fuck off; except to people with predisposition to depression and the inability to express themselves (this was before I started taking medication), that sort of nastiness is not bearable. After ten months of this I was so ill I was crying constantly, eventually I went into hospital and started on medication. Somebody else he did this to (over a year later!) got so depressed he took an overdose of pills, had to go on antidepressants and left.

And where does the "concrete proof" of this trouble exist? NOWHERE. Even if you had physical evidence, even if you had the presence of mind to record what was said, how could you prove what he actually meant by what he was saying? In some cases of harassment you can prove what was done, because it's undeniable. But when the harassment is done with any presence of mind whatsoever, it becomes difficult. In the case of the wider harassment, the people doing it obviously know what they're about - they must have done similar things to other people before in one form or another, and they know what they can get away with, they know what the police will do nothing about.

>I seem to recall that last time this was being discussed someone asked if you
>had been to see a psychiatrist about this - after all if this is really
>happening then you have can only benefit from being given a clean bill of
>health. I don't recall an answer.

Yes. The reply was of the "neither confirm nor deny" variety. Not much else they can say, is there?

>Well how could they? Who would you sue? The country?

Hmmm, now there's a thought... :-)

>If this gets out then *that* will be the time to bring your claims to the
>foreground.

Wrong way round. It won't get out unless I do something to bring that about; remember, it isn't in THEIR interest for THEIR criminality to be exposed. Yelling loudly on Usenet might nudge things along in the right direction.

>The only thing ruining your life right now is you, Mike. And the only thing
>that will make your life any better now is also you. So go and make your
>life better and show them that they failed.

Ignoring them would be bliss, but it's not a winning strategy.

There are going to be more of these posts. Sorry. That's the way it is.

>Very unstructured, no proof whatsoever. So why should anyone
>take it seriously? If I said to you, "my next door neighbour eats
>babies", how much credibility would you attach to that?

Well, cos it's true. I was hoping that someone "in the know" would
appear and make some self-revealing comments, but that hasn't
happened. Everyone's keeping quiet. What a pity.

>>This is an agglomeration of articles and replies previously
>>posted to Usenet, so it's a bit hard to read. This posting
>>describes a campaign of character assassination initiated

>Who's character is being assassinated? It isn't clear from the post.
>Are we talking about Grenville Janner? I thought he was a spook
>himself? He's certainly able to hold his own on the issue you cite.

Mine, mainly. The reason for putting that episode at the top
of the posting is that they tried to kill two birds with one stone
at the Beck trial - they simultaneously put words into the mouth
of their invented "witness" to smear Janner, and repeated exactly,
word-for-word, stuff which had been said by and about me.

That was the only occasion (the only one recognizable to me,
anyway) when they went after another target at the same time.
And it's quite lucky they did that - because it could give some
pointers to who they might be.

Presumably there are people still around who were involved in
that trial, and know what happened. Beck might be dead, but the
"witness" would still be around, as would Beck's solicitor.

>>by a group of people or agency within the UK. Although
>>they have never presented their identity, you can draw
>>your own conclusions on that point. There aren't many
>>people with the technical resources and contacts in
>>society to make feasible the sort of deliberate attack
>>on an individual which is described in this article.
>
>There aren't _any_ as far as I am aware.

I'm afraid there are.

>>The most disturbing part of the whole episode is the
>>participation of British institutions and their members, fully
>>comprehending what they do, in what is an act of attempted

>>murder against a British citizen.
>
>The whole society, in fact. From the top to the bottom. They
>wouldn't be trying to tell you to kill yourself by any chance,
>would they?

You got it. I'm a popular guy.

>>After the trial Janner said that "now he knew what it felt like
>>to be a victim of Beck's"; but, it wasn't Beck who set up the
>>attempted character assassination on Janner; the fact that they
>>took a side-swipe with their verbatim repetition shows
>>where the real source is to be found.
>
>The newspapers?

Well, your guess is as good as mine. But what newspaper would
send a team after someone for five years? I don't think so,
somehow. Of course they could, but it wouldn't be in their
commercial interest.

You'd have to look at a corporate entity which would indulge in
activity of this type, and the nature of the contacts they have
narrows down the search.

>>The goons behind the molestation are lower than the paedophiles
>>they use to convey their propaganda - they use the same
>>strategy of covert abuse, but there is nobody to check their
>>actions, or to bring these criminals to justice.
>
>Ummm.. Janner is a Barrister, a journalist who writes on a wide
>variety of issues, and a long-standing Labour MP. If he's unjustly
>smeared, he's more that capable of setting the record straight.

Janner blamed Beck for the invention. He didn't say anything about
it having any other origin. Even had he suspected any other source,
he could hardly have pointed the finger without some evidence.

>You say that the media is making similar allegations about you in
>relation to this issue? So, you're accused of child abuse, amd
>the allegation was reported in the media, I assume.

I've been accused of many things although that wasn't one of them.
Most of them have been yelled in my face by people on the street
in London at some time or other. Bit difficult to misinterpret
when that happens.

>What exact;y are they saying about you? (Respond here please. I'm
>leaving the UK tomorrow, so I can't read e-mail.)

It changes with time. Every so often, they sing a new song;
so at one point the allegation was homosexuality, at another
is was low intelligence, then it degenerated into sexual abuse.

<snip>

>>They invaded my home with their bugs, they repeated what I
>>was saying in the privacy of my home, and they laughed that it
>>was "so funny", that I was impotent and could not even communicate
>>what was going on. Who did this? Our friends on BBC television,
>>our friends in ITN, last but not least our friends in Capital
>>Radio in London and on Radio 1.
>
>How do you know this? Just from what you hear on the radio?

I can't remember if this was mentioned in the "regular" posting,
but on a few occasions they set me up with people nearby to talk
about me, or more correctly, to talk about somebody who
(in their minds) "resembles" me, with actually naming me.

One such occasion was a coach trip to Europe in June 1992.
The "set up" comprised a guy talking to a vacant giggling female
about "this bloke", who was never named. Apparently "they"
(also never named) "found somebody from his school",
"they" "got" him at his house and at a neighbours, and at
a B&B where their target was for one night.

Apart from that, yeah, from "what I hear on the radio". And
from what I see on TV. (I wouldn't be doing my job as a
mentally ill person properly if the TV and radio weren't
talking to me, now, would I?)

>>Oh yeah, I can see it now. All of them banding together, in a united
>>effort against one man. So ITN, the BBC, and Capital all decide to sit
>>round the table and they come up with idea of breaking into someones
>>house, putting bugs everywhere, listening in to his conversation, and
>>shoving it out on the news everyday.
>
>But why would they do this? What possible reason would they have?

But why get at anybody? Victimisation is the pastime practised against
other people; as the scorpion said to the frog, "it's in my nature".

>Are you aware that what you describe is also a common symptom of people
>who are suffering from a psychiatric illness? Have you been to your
>doctor and told him about this? Did he prescribe any medication? Have
>you been taking it, or have you stopped?

Yes, Yes, and Yes respectively. Still taking it. Doing quite well actually.

>>This someone has nothing to do with
>>politics, or business, or entertainment, just an ordinary Joe Bloggs who
>>seems to be extremely paranoid.
>
>Usually a clinical symptom rather than proof of a conspiracy in such
>matters.

>>How did they do this? I'll give you an example. About a year ago,
>>I was listening to Chris Tarrant (Capital Radio DJ among other
>>pursuits) on his radio morning show, when he said, talking about
>>someone he didn't identify, "you know this bloke? he says we're
>>trying to kill him. We should be done for attempted manslaughter"
>>which mirrored something I had said a day or two before.
>>Now that got broadcast to the whole of London - if any recordings
>>are kept of the shows then it'll be there.
>
>And this is supposed to mean... what? Chris Tarrant is in on this plot
>to kill you? It sure sounds like a joke to me. When you start to get
>ill, the mind often makes connections that seem logical and lucid to
>you, but do not to the rest of the world. This is one of those connections.
>They are usually known as delusions.

This is the problem, and there doesn't seem to be any way around it.
If a clearly sane person reported this persecution, you might believe
him, but probably you'd tell him to go see a doctor to "verify his
sanity". If someone with the illness of which you could argue these
things to be symptomatic says these things, again, you might believe
him, but it would be unlikely - the easiest route is the one you are
taking in the above paragraph. The only way I can convince you of what
I am saying is by giving precise details of what, when, how - and for
most of that stuff is based solely on memory.

To prove it would require an admission from somebody, or else hard
proof in the shape of physical evidence such as tape recordings.
Of course, I don't have that.

>The idea of a "pattern", and the notion that if anyone could look
>through your eyes they would see the same thing is very indicative of
>the onset of a psychiatric illness. Schizophrenia and manic depression
>have similar symptoms. I'm not trying to be disrespectful here.
>This may be an illness and it can be managed by the use of medication.
>If it _isn't_ treated, it can lead to terrible tragic consequences.

I'm quite aware what the symptoms would be, and that the reality
corresponds to those symptoms.

But if anything, that is an argument which could convince you of
the truth of what I'm saying. If they deliberately set out to
simulate the symptoms of schizophrenia - in other words, if they
know through observation that their target is either suffering
from the illness, or is on the borderline and could be pushed in
with an appropriate stimulus, then they can feel safe in what
they do, since once you are registered as suffering from the
illness, people will assign less credibility to assertions that
persecution is based in reality.

That this can happen, and people collude by silence, is absolutely
horrifying. It is all the more horrifying that it can happen in a
country such as Britain which has no history of repression.
Perhaps its happening in the UK is due to the arrogant assumption

of moral superiority on the part of those in the media and others involved - we won the last war and we can keep harping on about German and Japanese war crimes, so we can do whatever we like and we'll be right, up to and including destroying the lives of our citizens (as long as we're not caught doing it).

>>That is the level it's at - basically they show they're listening
>>to what you're saying at home, they show they're listening to you
>>listening to them
>
>But why? And why you? Do you realize how much it would cost to keep
>one person under continuous surveillance for five years? Think about
>all the man/hours. Say they _just_ allocated a two man team and a
>supervisor. OK., Supervisor's salary, say, £30,000 a year. Two men,
>£20,000 a year each. But they'd need to work in shifts -- so it would
>be six men at £20,000 (which with on-costs would work out at more like
>£30,000 to the employer.)
>
>So, we're talking £30,000 x 6. £180,000. plus say, £40,000 for the
>supervisor. £220,000. Then you've got the hardware involved. And
>any transcription that needs doing. You don't think the 'Big Boss'
>would listen to hours and hours of tapes, do you.
>
>So, all in all, you couldn't actually do the job for much less than
>a quarter million a year. Over five years. What are you doing that makes
>it worth the while of the state to spend over one and a quarter million
>on you?

Those are pretty much the sort of calculations that went through my head once I stopped to consider what it must be costing them to run this little operation.

The partial answer is, there have been periods when the intensity has been greater, and times when little has happened. In fact, for much of 1993 and the first half of 1994, very little happened. Although I don't think that was for reasons of money - if they can tap into the taxpayer they're not going to be short of resources, are they?

The more complete answer is in the enormity of what they're doing. When countries kill their own people, as a rule, they get found out and all hell breaks loose. This isn't some para shooting Irish teenagers in the back. This is something which permeates English society, which they are ALL responsible for, and which they cannot escape responsibility for.

Relative to the cost to British pride of seeing their country humiliated for the persecution of their own defenceless citizens, isn't is worth the cost of four or five people to try to bring things to a close in the manner they would wish? To the government a million or two is quite honestly nothing - if they can convince themselves of the necessity of what they're doing,

money is not going to be the limiting factor.

>>What possible reason? I guess because they think it's amusing to do
>>so.
>
>What? Spend a quarter mil. a year to amuse themselves? And why not
>change every now and again? Why keep watching you? (Unless you _are_
>doing something, and I don't think you are, though you may have some
>deep, dark secret in your past.)

See the above.

Sure, it "leans" towards it. But please at least admit there is a
POSSIBILITY of it being very real. And once you've done that, can
you come up with some thoughts on methods of proof? I may be missing something
in my assessment - there may be a way of proving it, in the face of non-
cooperation from the "players".

>Hmmm, strange eh.
>I mentioned all this goings on to my boyfriend, who works for the
>British intelligence service, and he assures me this sort of thing
>never goes on.. not ever...honest.
>Though he said the name was familiar...

it does go on, although it's an open question who does it.

Some time ago there were press reports of an Army intelligence person called Jones who claimed Diana and Hewitt had been photographed in a compromising position... he said he'd been doing this as part of an Army unit which had previously operated in Northern Ireland.

Then Hewitt said he'd been told the same thing by some Army people, and that they were threatening to release the tapes unless they curtailed their liaison... as per usual everyone denied everything, painted Jones as the "Jones twins" - not very original in how they deal with their perceived enemies, are they?

You have to wonder how they manage to achieve this sort of surveillance though. Audio you can understand, it's possible to put a microphone through the wall, and apparently there exist devices which will retrieve sound from a laser beam bounced off a window - sounds sci-fi, but there's a well known surveillance electronics company in London which sells these things.

But how would you get video out of a room, unless you had actual physical access in order to plant a device for pickup? We're not talking about looking in from afar, but an actual device within the room. You could either drill through the wall and shove a pickup through; or you could supply a trojan device with a hidden pickup inside; but most likely, you would have to physically break into your target room to plant a camera. That's not an infeasible option; all it means is having your target(s) watched to make sure they're not in the vicinity, then you negotiate any locks on the property and find a suitable receptacle for your device.

The next question is how they defeat the usual methods of counter-surveillance. We had private detectives carry out a "sweep" of every room and the telephone line. They found nothing. That indicates at least four possibilities that I can think of; (this is all guesswork BTW, and probably fanciful guesswork at that!)

1) no bugs (pull the other one)

2) radio-transmitting devices which can be controlled from an external source, ie you can instruct them to switch off when you detect a counter-surveillance sweep taking place

3) hard-wired devices; probe microphones or whatever they're called, things you poke through the wall

4) passive surveillance devices; so you bounce laser or radio waves off a suitable reflecting surface (again, sounds far-fetched but such things may apparently exist).

5) there is a fifth possibility, that the PI's didn't detect an actual transmitting device; there are technologies specifically designed to avoid detection, eg frequency hopping and suchlike. But how much sophistication could you build in to a device which would have to be small enough to be physically concealable?

I guess the real question is to find out who is ultimately behind these "goings on". And if the "great and good" (or the better known, at any rate) can't protect themselves, what hope is there for the rest of us?

Andy writes

Does anyone know where I can get a (free) schematic of a
Kenwood ST-1 base station which is built to hold a TR2400 handi
talkie....???

It contains a charger for the TR2400 and I'd like to have a copy
of the schematic lying around in case it stops working someday..

Thanks in advance for any good advice,

Andy W4OAH in Eureka, Texas

254. Where does part 97 end and part 15 begin?

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-01-26 02:23:30 UTC
From: eternalsquire@comcast.net
Message-ID: <1169778210.634297.63500@a75g2000cwd.googlegroups.com>
Source record: 8642

All,

I have a situation, and would like some opinions rather than flames on how to handle it. My wife teaches at a public school just off the Easter Arizona Navajo reservation. Lately, a junior school science teacher is starting up a science club and has asked me to provide for the amateur radio side of the club and be its control operator.

She believes that the kids would be fascinated by the Morse code - Dxing - Construction end of the hobby, even though Morse is no longer a required test element.

The kids are mostly Navajo and thusly have a very limited technological background (hence the reason for the club to stir the interest), so I need something concrete with immediate payoff to keep their interest hooked while getting them as ready as I can to write their Technician exam. The nearest VEC is 4 hours away and I'd rather have as few fail as possible.

I had thought to start an unlicensed micro-power code practice net whose range would be limited to about a 30 mile radius, which is about the size of the local reservation right next to the school.

What I want to do is provide each kid with a popcorn CW transceiver for the colorburst frequency (3579 khz), a key, a short random wire, and a battery. That way they could practice amongst themselves with myself as occasional net control.

My question is this: so long as final output to the antenna is within the requirement of part 15 unlicensed operation, is part 15 unlicensed operation allowed within a band normally governed under part 97? Part 15 operation would easily cover a 30 mile radius on 80M.

If no, I'll run the net under part 15 on the edge of the AM band near 160M.

Thanks in advance,

The Eternal Squire

[much snippage]...

I won't flame you at all -- I admire your elmering, and think it's a
great idea.

I'd be exteremely careful to make sure you meet the field-strength
requirements of Part-15 with whatever project you do -- it can be
remarkably easy to get foul of it and reliable measurements require
skill.

Besides 80m and the top of the AM ex-band you might also consider
the lowfer 1750m stuff ... Lots of kits out there for it, and an
active user community.

Of course getting them all licensed would be the best solutiuon ...

Junior high is probably just at the edge of where passing the novice
or tech written would be a cake-walk. As I used to joke to my
classes, "there's three parts to the written -- three engineering
formulae: E=IR ; c = f lambda ; 40inches in a meter., a handful of
common sense questions, and a few memorizable factoids" (band edges,
etc.)

I had a sixth grader of average intelligence in one class - it was a
little harder for her, but she passed it on her second try.

OhHellNo! Techs need to memorize band edges and remember the 2 basic
rules: E = I * R, c = lambda * f, and a meter is really close to 40".

I doubt it's even on the _commercial_ exams any more, though it sure
was when I got my Second Phone, back in 1962.

http://www.access.gpo.gov/nara/cfr/waisidx_06/47cfr15_06.html

Part 15.223 says in part...

"Subpart C_Intentional Radiators
Sec. 15.223 Operation in the band 1.705-10 MHz.

(a) The field strength of any emission within the band 1.705-10.0
MHz shall not exceed 100 microvolts/meter at a distance of 30 meters.
However, if the bandwidth of the emission is less than 10% of the center
frequency, the field strength shall not exceed 15 microvolts/meter or
(the bandwidth of the device in kHz) divided by (the center frequency of
the device in MHz) microvolts/meter at a distance of 30 meters,
whichever is the higher level."

For CW operation, your bandwidth is zero for all practical purposes. You
will therefore be allowed 15 uV/m at 30 meters.

From this I made a very crude estimate of your allowed transmitter output
power. Assuming your transmitter antenna is 100% efficient and radiates
hemispherically, your transmitter output power is allowed to be no more than
about 1.7 nanowatts (1.7e-9 watts). For ideal circumstances (0 dB receiver
antenna gain, 100% efficient receiver antenna), you would get less than 5 uV
at a receiver 400 meters away. I stress that this is for ideal
circumstances. If your transmitting antenna is less efficient, you can run
more power, but less of your power gets launched. How efficient is that
antenna, anyway? On the other hand, your antenna may have some directivity
which would further limit your power.

This is making my head hurt.

All that can really be said about this estimate is that, to be safe, you
should not have much more than about 2 nanowatts output power unless you
have the ability to measure the field strength according to regulations.

Good luck with your project.

73,
John

The last thing in the world you want to do is give them the ability to
send and receive. Because then you'll get a bunch of senders and nobody
who can receive.

I made the same mistake when I was ten and got a morse code set. Two
units connected by wires, and you could switch between a morse sounder,
a light bulb or a buzzer. It was great for sending away, but the problem
was there was nobody to receive. And sending didn't mean a
thing in learning to receive.

I think it's correct to believe that youngsters would be interested
in morse code, a "secret language" at an age when "secret language"
means something.

But I don't see this helping.

You need to send to them, something they don't need licenses for or
a worry about whether the transmitter needs a license or not. But
then, they do need receivers. Only later will they have the ability
to communicate with morse code.

They don't need license-free transmitters to get a feel for ham
radio. They can talk (and if they know morse code, send) as third
parties over your station. You can build up simple receivers for
them, or better yet get them interested in building their own simple
receivers, and then listen to a ham band or your code practice
transmissions.

Building the receivers is a way to get them enthused about the hobby,
if done right. Again, getting the thing to work is a sense of
accomplishment, and it doesn't matter how simple the receiver might
be.

Charles Kitchin has had some simple regen receivers in QST in recent
years, using easy to get parts. I looked at one and everything could
come out of a good junk box. He had one that used a color subcarrier
crystal, again an easy to get part and which made it easy to tune. At
least one of the articles is at the ARRL website for all to access. Do
a websearch on his name, and you'll find that various clubs have done

it as a group project.

But also, when amateur radio is taught in schools, it always looks good, because so many pass the test. I'm not so sure so many stick with the hobby. Some of what's appealing about the hobby is that it's not for everyone. I passed the test when I was 12, and it was something to boast about at school, if school hadn't ended just before I got the test results. I'm not convinced it would have had the same appeal if it had been a regular school thing.

So often amateur radio benefits those school kids as a catalyst for other things. And thus it's important that in this case getting the ham license isn't the end goal. Getting them interested in learning, getting them interested in building, even getting them interested in communicating should be the goal. If they get something out of building a simple radio receiver, then that's more important than passing a test but getting nothing.

So letting them be third parties on your radio, and talking to distant places, or even other reserves, is beneficial, whether or not it leads them to getting a license. Getting them interested in building, be it a radio receiver or some other gadget that can be made with junk parts, is beneficial in itself. (And maybe a reservation isn't the home of much electronic trash, but it's generally so easy to get that they could learn from the act of taking things apart.) Build up various means of sending morse code, and use that as demonstration of things, rather than seeing morse code as the goal. You can send morse by radio, and light, but you can also modulate a light so you get a tone with morse code out of the speaker at the receiving end. During WWII there was various activity using the earth to send and receiver (since ham licenses were in suspension), and that's another neat thing. You need to show them that there are neat things, before they can pursue those things.

These things are the lure to get them interested in amateur radio. They help to make going after the license appealing. But if it's done right, they will benefit long before they make a decision about getting a ham license.

In fourth grade (1952) a camp counselor had built a voice radio transmitter that put out a signal on the broadcast band that we could hear all over the campground. Was it illegal? HELL yes, it put out almost a watt into a random wire antenna. Could it be heard a couple of miles away? HELL no. It was a watt into a junk antenna.

That illegal transmitter put this kid into a 50 year career as an electronics engineer with a lot of stops along the way.

My advice ... build a VOICE transmitter that has a couple of miles range and let the kids have fun with it.

Licenses, we don't need no steenking licenses...

Jim

Ignoring your legal question, a suggestion:

Radio isn't too impressive among kids these days. Especially in
lesser-developed parts of the world (I honestly don't know how much
that overlaps with these kids?) everybody has a cellphone anyways.

So if Morse code is to be an attractor (and it is, being an arcane art
with secret-code aspects, going to be somewhat attractive to at least
some kids), start with wired operation. Yeah, it's really super-basic:
battery, key, beeper, wires, maybe a blinking light bulb. But if you
skip the basics (and it sounds like these kids may have already missed
the basics) then they'll get nothing out of it anyway.

I've worked with similar school-age kids in a vastly more
developed/educated part of the U.S. and they generally don't know how
to wire a light bulb to a battery even though they all know how to use
a USB keychain to exchange MP3's via myspace accounts.

If you're lucky, you'll find a one or two techie kids who take after the detailed radio interests not too different than your own. Otherwise, aim low, very very low in terms of complexity, in an effort to bring up the low end rather than cater to the one or two kids who would really benefit from your more advanced plans.

Tim.

266. L/Series network tuner

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-01-26 14:51:09 UTC

In looking to build a tuner, I was looking at an L-network tuner, with switched inductance. If I also add a switch to make it a series-network (capacitance "before" or "after" inductance), what would be the limitations of such a design? I.e. What types of antennas, or under what conditions would it be inappropriate?

Thanks.

And they say the American spirit is dead? They say the men have all
been "feminized" in America? They say the pointy-head attorneys have
brain washed everyone with threats of litigation? They say the
multi-dollar corporations now run the people like a heard of sheep under
thought control?

Hmmm, I wonder ... <grin>

Warmest regards,
JS

Tim:

I really find there is a LOT of interest in radio these days.

Example:
The wife and I got a pair of maxon 49.??? Mhz communicators, vox, etc. At first, we got them for the motorcycle we had, the head gear can be jammed under a helmet and the transceiver clipped on a belt, great for talking while going down the road.

Lately, with the super walmart and all, we have been using them while shopping, it is always easy to locate her in the store and we can shop together even though we shop apart. Or, I can wait outside and just meet here when she is checking out.

Point is, I can't get through the store without someone striking up a conversation over these things. If I mention other areas of radio I am involved in, it can easily turn into an hour conversation ...

Point being, an interest in radio is actually easy to begin in others. Biggest problem I have noted is that people just don't talk anymore, with these "conversation starters" on, they do!

Regards,
JS

John,

So, say I had a CW oscillator on the colorburst frequency. I'll shunt
the output
with a 50 ohm resistor to ground. I'll put a random wire at the top of
the
resistor.

Basic equations yield P = (EE) / R

If R is 50 Ohms and maximum output power is 1.7e-9 watts, then E
is 4.1e-5 volts.

So, would a measurement of 40 microvolts or less across the resistor
be satisfactory?

Thanks,

The Eternal Squire

Okay, suppose I make a colorburst CW oscillator and shunt it with a 50
ohm resistor.
I'd put a random wire at the top of the resistor.

So from basic equations P = (EE)/R, with a power limit of 1.7 nanovolt
this gives a voltage limit of 0.6 microvolt.

I'm afraid I don't have a voltmeter or scope that goes that low.

Myself and a colleague discussed the number of permits and variances
needed to launch real, orbital-type rockets and wondered how much would
be required if you launched from a Native reservation.

I think this is an excellent, and well-intentioned, idea in principle.
Others here have given good advice about being careful about power
levels. The Technical Information Service (TIS) at the American Radio
Relay League (ARRL) has put together a very comprehensive and
informative web page relating to Part 15. It's particularly helpful in
explaining about how Part 15 fits in with Part 97. It can be found at:

http://www.arrl.org/tis/info/part15.html

Especially note the "Myths" and "Scope" links at the above site.

The Navajo people have a proud heritage for their WW2 participation in usage
of their language for communication in the Pacific (Japanese could not break
it). See movie - Windtalkers (and a couple of others).

CW may be of interest to some - in that it is also a human translated
code --
that was a foreign to 19th century US citizens -- as Arabic is to many 21st
century Americans today.

You should contact the VEC to see what accommodations they could make -- to
assist you for testing. Good luck with it.

Hi Marc:

TenTec has made tuners of that design for many years. I have one in my shack and it works very well for me. The advantage of the L-network over the more common T is in ease of tuning. The L-network has only one correct tuning spot for each load. The T network can have several "matching points" some of which can result in large internal losses instead of an efficient match. The L network has slightly less loss when matched than the common T network. The main con for the L network is the requirement to switch the capacitor around to match loads that are greater or smaller than the input load.
Other than the above both networks do the same thing and there is nothing T network can do that the L network can�t and it needs one less capacitor than a T network.
You can see I�m biased to the L, try one you will like it.

Nope. It's not on either the Tech or General exams. It does show up on the Extra exam. Even at that a person might or might not get that question on their particular exam. Take a look at the Tech test pool on the ARRL set. You will see that it just covers basic stuff.

I am not a lawyer. When faced with legal questions about my own operation, or when trying to help keep apparently honest and sincere people like "Eternal Squire" stay out of trouble, I defer to the true experts. Existing, compiled, and expert advice like that provided at the ARRL TIS site I previously mentioned would seem to be a good place to start. I also value the insight provided here by Usenet participants who are attorneys with experience in communications law. I would certainly defer to their input on this matter, if offered (*).

I also ask myself if I am obeying the spirit as well as the letter of any law or regulation. I don't feel it's within the scope of good amateur practice, personal ethical conduct, or even just overall "good neighbor" guidelines to be focusing on alleged loopholes such as being on a Native American Reservation, in international waters, or an "educational project." Often such excuses are transparent, self-serving, and not borne out in actual legal practice, regulations, treaties, enforcement, etc. Unless I had a lot of legal resources at my disposal (pro bono counsel, etc.), I would probably not seek to try and make myself a legal test case, as some on the newsgroups seem bent on doing.

I would hope that "Eternal Squire", whose post implies that he is a licensed radio amateur, is thinking along these same lines, also. I offered my layperson's advice in that context.

>Here is a paper which will demonstrate there is "quite a bit of
>controversy" over legality of 97 and 15 on reservations:

>http://www.fcc.gov/sptf/files/0801fcc.pdf

I read the above transcript you provided. I note with interest that my friend, fellow ham, and Usenet peer Carl Stevenson (WK3C) was a member of this workshop. I'd certainly defer to his technical expertise. However, the gist I got from the transcript, and from asking legal experts, is that case law is mixed on the subject of whether what

happens on a reservation is strictly an internal, tribal matter. That no one present at the workshop wanted to venture an authoritative answer doesn't meant that there aren't those involved in enforcement who could give one. Radio transmitters and casinos are given as principal examples where case law, practice, and jurisdictional agreements go against the assertion that on a reservation, U.S. law does not apply.

>Course, with some, an amateur license immediately makes them an
>authority in all areas ...

It was a question about amateur radio, asked in an amateur radio newsgroup. I suggested that he seek expert advice, such as that summarized at the ARRL TIS web site I linked previously. No more, and no less.

>Warmest regards,
>JS

(*) I did ask one of the experts in communications law that I know personally. He offered the following observations:

"I would add something to the extent that you have been advised by a communications attorney with over 50 years' experience in FCC regulatory matters that unless there is a specific treaty granting a tribe authority to regulate amateur radio transmissions on a reservation, and there isn't, FCC law and jurisdiction prevail. There are agreements giving tribes authority to determine who may operate a broadcast station from a reservation, but the FCC must regulate the technical parameters (frequency, power, location) to be observed and grant the callsign and make all necessary international notifications.

Similarly, in international waters or airspace, the country of registration of the vessel or aircraft retains jurisdiction, and any country may lodge a complaint of violation of the International Radio Regulations with the country of registration if that is the case. If the vessel or aircraft is 'unregistered', any country has the authority to blast it out of the water or the air, although that is a drastic measure. The International Radio Regulations do, however. oblige all countries to not condone or support any radio (or TV) broadcasting from international waters or airspace."

As this seems to be drifting into a *.policy area, and not *.homebrew, I've set followups as appropriate. Feel free to override my default if you must.

Well, I must admit, anyone affiliated with the ARRL turns me off, as it does many. Although they cannot, possibly, be held directly and solely responsible for bringing amateur radio to the brink of disaster it now hangs at, they certainly have never helped much, well, other than themselves.

However, I would strongly suggest anyone to investigate all of the options open to an Indian reservation, the laws which govern them are much different than those governing all other areas of the USA. If I read that paper correctly (mentioned in my earlier post), the FCC would seem to be mostly interested in the rf which left the borders of the reservation.

I know ripples of shock went through the population of California when they were allowed to operate gambling casinos. Something most did not expect.

I would not be surprised if further surprises along those same line do not await us ...

Now, as to the rest, I am simply not impressed nor interested ...

Ok, please dont everyone get mad at me, but I just started puting this together and I really would like to promote my new holography kit and I

think it may be something of interest to you all. I put together a web sight, and I would also like feed back on the sight.

So PLEASE even if you dont go buy one (and I dont blame you, it's not everyone's thing) please give it a look and if you have any sugestions,

let me know, I actualy plan to 'open' on feb 1st, but the sight is funtional, just unadvertised now. Any way the addy is

http://dcgkit.t35.com/

I hope no one is upset, I know it's a comercial endever, but I do think

it's a subject of interest to the group.

Daniel

As I remember, gambling on reservations had almost that/those humble beginnings ...

It is clear, in my personal opinion, the FCC would have NO interest in rf levels on the reservation, and ONLY those leaving the borders of the reservation would EVER come into question ...

People living on the reservation have all the consumer electronics that
can be interfered with that people living off the reservation have.

Jim:

Let me go a bit further on this. I happen to have a sister who works
for Child Protective Services in California (CPS.)

If you are Indian (even part) and CPS pays you a visit, and you ARE
Indian, they must immediately back down and defer to the Indian Council
on the reservation/tribe which the person in question is a member of ...
that individual is NOT subject to the same laws you or I would be.

Let me go a bit further:
If you are Indian, the welfare agency will provide "different" benefits
to you than some others. Indeed, the Washoe Tribe of California and
Nevada "chip in" and provide you with "expanded" benefits and medical
assistance.

The above was/were gleaned though discussions with my sister over time
... anyone interested can investigate for themselves. I am intrigued by
the fact the Indians care for their own so well; I would be interested
in knowing more.

Regards,
JS

Jim:

Most likely equal or better!

Those Indians living on the reservation in Amador County receive approx. $5000.00 per month/per individual.

A family of three would get about $15,000 a month from the proceeds of the casino, if they actually work in the casino, more ... they don't pay taxes on their cigarettes either!

That just ain't bad, and leaves a couple of bucks left over to purchase hobby items ... some drive nice Hummers, I have noticed ...

I think it would be about 300 uV across 50 ohms (I think you are off by about an order of magnitude). Yes, I think that would be okay. A good place to understand this stuff is on the ARRL site. Look into the BPL and RFI things there. Read everything you can find about this subject. If you research this thoroughly, you will find allies in the field, I'm sure.

My intent here is not to discourage you in your project, but to encourage you to think critically. Always ask yourself why this has not been done before. Most of the time there is a reason, but sometimes (a small percentage of the time) it is because nobody has had an interest in the subject.

But, you didn't ask for my philosophy. I sometimes get carried away. I apologize for that.

Cheers and 73,
John

I have been thinking about this for a while before making this reply.

I would strongly suggest looking at the lowfer band.
160Kc to 190Kc
The limitations are relatively straight forward.
Maximum length of feed line, and antenna are 15meters.
Maximum power input to the final amp stage is 1W.
No other real limitations besides the fact that out of band emissions have
to be below a specific point.

That is about a 50 foot long antenna. There isn't much of a chance that they
will try to string one up longer than that, unless they were really
industrious.
And they can learn about antenna loading, to get a better transmitted
signal/range.

The one watt input power level is easy to determine. If the input is 10V
then adjust the current to a maximum of 100mA.

They can use any mode of communication they want. CW, AM, SSB, FM, PSK31,
BPSK, MFSK
The sky is the limit as for as modes.

If they have computers, most of the digital modes can be implemented with soundcard based communications software that is available as freeware Look up "MULTIPSK"

They can set up beacons for propagation checks, or talk to each other in real time.

30 miles is an easy distance to reach with basic loaded antennas. Especially with PSK31 and CW.

It will allow them to learn how to build receiving antennas.

And if they can't reach, or hear someone on the other side of the reservation, then it will allow them to learn the basics of traffic handling by the stations in the middle relaying information from one station to another.

It will also teach them the basics of the narrower bandwidth/greater range relationship. With the low bandwidth BPSK, PSK31 modes, they will easily communicate across the reservation even if they can barely hear each other on voice.

You can either get kit equipment for receiving or transmitting, which is widely available on line. Or you can design and build your own.

If they are lucky, they may even hear stations, and beacons from hundreds of miles away. Or even thousands. There is nothing like the thrill of DX.

If (mind you, IF) I was going to make a device that would bootleg a signal over a 30 mile range, the LAST frequency I would pick is one that had a real good chance of messing up somebody's color TV set in that radius.

Google on Mouser, crystal, and you will get HUNDREDS of cheap crystals that aren't going to be messing up anybody's home entertainment devices. You might also google for "emergency frequency" to keep away from the Coast Guard's "hit the red button" frequencies.

If it twer me, I'd probably find a quiet spot on 80 meters for the little rugrats.

This may not be what you are looking for but it is a
clever way to make a Hartley oscillator using two
inductors without any coupling between them:

"Hartley oscillator requires no coupled inductors,"
by Jim McLucas, EDN Design Ideas, issue of
26 October 2006. The example is an 18 MHz
oscillator using dual-gate CMOS FETS but the
principle of transforming coupled inductors to
two individual inductors would be sound for any
active device.

It is available at Design Ideas Archive at
www.ednmag.com.

Maybe I should clarify one of my statements before someone calls me stupid.

I mean easily modifiable equipment is widely available online.
It isn't sold for Lowfer operation.

Most heterodyne and direct conversion based short wave, receiving kits can
be modified over to the LF band from 160 to 190kc

On a 455kc heterodyne receiver, push the local oscillator down to 615 to 645
kc, and put a band pass network on the input peaked to the lowfer band, and
you are done.

Same thing can be done for SSB transmitter kits that use a fixed transmit IF

Only thing is, such low power xmitters, if designed and tuned to a
"quiet" portion of the mw band allows anyone with a standard am radio to
tune into and participate in ...

Rip apart any old transistor radio and you have the necessary parts for
the xmitter ...

VLF receivers can be a tad bit expensive ... however, most am radios
would easily be modified to VLF ... the patience of the elmer would be
the only resource in question.

I agree. I was just rebutting the bad advice given here that you should try to focus on legal loopholes or otherwise "stretch" the law in some way. Especially when that advice is based on an incomplete or inexpert knowledge of the law, whose misunderstanding could have expensive consequences. I know that hams in general are an honorable lot, and as a whole would not attempt to think or act that way. I'm glad that we are thinking along the same lines. Which is one of the reasons that I believed that you were sincere, and a licensed amateur radio operator.

>>From what I understand, Native territories are jurisdictions having
>roughly equal standing
>to the states, but just like states are still subject to the
>Constitution and to Acts of Congress,
>such as the one authorizing the FCC and parts 15 and 97.

Treaties with Native American tribes, and resulting laws and inter-jurisdictional agreements bear out that viewpoint, according to the expert that I consulted, and quoted in my previous post.

So, the one remaining question would appear to be your original one, which was where does Part 15 leave off and Part 97 begin? I think that the ARRL TIS site that I linked previously is a good place to start. I invite everyone to consider the excellent advice offered at that site, including links to FCC documents, independent of prejudicial dislike of the involved sources or personalities.

>As for using a pseudonym, I use that rather than my name or call for
>obvious reasons of
>personal safety for myself and my family.

That's too bad that Usenet has degraded to the point that we actually fear for the safety of ourselves and our families when we participate here, and merely state our intentions to operate lawfully, and not tolerate unlawful behavior. I'm honestly surprised that these are controversial viewpoints in some quarters.

Personally, in nearly 17 years of participating on-line, I've never felt
the need to use a pseudonym, or feared for my safety. However, I
respect the reasonable personal choices of others in this regard.

The first thing that came into my mind when I read that is.
Is there even such thing as a "quiet portion of the MW band"?

The normal AM band has so many multiKW stations running on it that it is heavily polluted with RF noise.
The general coverage receiver I have, has a 200 Foot long antenna hooked to it.
Night or day, It is hard to find a broadcast channel that isn't giving a signal reading running from S5 to S9 even when you can't hear any traces of a broadcast signal.
There is so many distant stations being heard at once that it turns into indistinguishable noise.

And if you do catch a quiet channel, it only last for a few minutes, or hours until propagation changes, and the noise level comes back up to normal.

Once you drop off the edge of the AM band, the average noise level drops down to almost nothing within a few Kc of the edge.

After you get past a certain grade of radio and RX antenna, you will not gain any improvement because of the base noise level of the band. They would basically be reduced to fighting the TX side of things, to try and stay above the average noise level.

Can you say "CB a few years ago"?

The only reason the horrible noise level isn't apparent on most AM receivers sold in stores, is because they are so insensitive that they can't hear even relatively loud signals. That is why I almost consider it a waste of money to buy a standard AM/FM radio that is currently on the market to listen to AM. I have built crystal radios that are more sensitive on AM than some of

the high dollar AM/FM radios I have used.

A lot of AM/FM radios I see any more, don't even have an IF section, with IF transformers. If you are lucky, they have a 455kc crystal filter, in a section that can barely be called a IF section.

You are taking a big handicap when you stay on the AM band, and use a standard off the shelf AM radio.

You have to use a radio that is designed for SW use, where the average noise levels are a lot lower, better selectivity, and the radio has a higher total gain from antenna to speaker.

If I was designing a simple software IF radio for them to use with their computer, Or a basic SSB voice rig, here is the basic layout i would use.

The IF for receive and TX would be 455Kc using off the shelf AM IF cans.

TX side.
450Kc or 460Kc crystal feeding a balanced modulator.
Soundcard driving the other input of the balanced modulator.
Feed the output of the modulator through an amplifier to an off the shelf 455Kc center frequency, 10Kc bandwidth, crystal filter used in the IF of standard AM receivers.

Feed that into a mixer being driven by a 630kc local oscillator.
That will yield a 170Kc to 180kc coverage signal that you can feed into a band pass filter.
Feed the band pass filter into the final amp.
Feed the final amp into the antenna coupler/ second band pass filter, and then to the antenna.

That will allow you to use about 1/3 of the entire lowfer band without changing any frequency in the transmitter.

Just set up the receiver with the exact opposite of the TX.
And you can use the TX crystal oscillators to feed the receiver, so the RX frequency will be a mirror of the TX one.

The antenna coming in to a band pass filter.
One stage of RF amp if desired.
Feed that into the RX mixer.
The mixer uses the same 630Kc local oscillator as the TX section.
Run the output of the mixer into an IF strip, with an identical 455Kc crystal filter.
Run it to a final detector being feed by the 450/460Kc crystal.
Feed the output of a detector into an audio amp, then to the input of the sound card.
Put a little AGC in here and there, and you are ready to go.

With that setup, they could have several conversations going at once on different digital modes, without bothering each other.

For an AM transmitter I would just use a crystal oscillator driving a modulated final amp.
And for the receive end, I would just use a modified AM receiver with a GOOD IF!!!. There is even a few general coverage radios that already has 160 to 190Kc coverage that would work fine for a receiver..

You have presented the above well, I am in agreement ...

The world is always a compromise between what one wants and what is
actually to be had.

Too bad there are none of the dollar-ninety-eight kits out there--like
there was when I as a boy. (or tons of old military equipment to be had
for a song)

Warmest regards,
JS

The solution is actually simpler.

Since realistically the kids don't need to communicate before they actually can, they need to receiver code practice. There is, again, ample chance to convey the hobby to them before they pursue licenses, and once they have licenses pretty much "anything goes" because of the very nature of amateur radio.

The solution is to get the community involved. These are their kids, they want them to do well in the world. Presumably there is a radio station on the reserve specifically for the reservation. So get some space there to send code (obviously a code practice oscillator into the microphone input) for a bit. It could even be as simple as a few sentences every day at a fixed time, the same way Jean Sheppard wrote of getting secret messages during the "Little Orphan Annie" show. The reservation near here has bingo games on the air every Sunday night, so why shouldn't a community that is interested in the success of their young not see the point of sending some morse code over the local station?

The point isn't to give them amateur radio before the fact, it's to lure them in.

And if there's no community radio station on that reserve, then I suspect that's of more value than low power stations that may turn out to be a dud. Because a community station can do so much for the community. And one might as well get those interested students involved in the project.

A few years back, at that nearby reserve that has radio bingo, one 13 year old lamented that there was no library on the reserved. They have a library now, it carries her name. This is something that is going to last forever (or hopefully so), and is the sort of thing reserves need. Libraries are places where people can find those books about radio and electronics when they suddenly become interested, or lure them in when they stumble on such things.

Getting the kids interested in science and even specifically electronics is a good thing. Done well, it will even benefit them if they don't pursue such things later, because the teaching becomes a catalyst for other things.

But sometimes one has to look at projects and wonder if they will really make change, or if they are just neat in themselves but will actually bomb (because the kids lose interest, or because all kinds of money and resource is put it into something when there are simpler things to do the same thing).

To Whom It May Concern:

Just so you have a complete picture of Paul W. Schleck, I took the following from one of his posts in news.groups.proposals:

"Mark Morgan, KB9RQZ, is correct that all of our proposed moderators and consultants hold the highest class of Amateur Radio Service license in their countries (Amateur Extra for the U.S. team members, Class A or similar in the case of Jack Cook, who holds both UK and Australian licenses). However, that doesn't mean that we would be judgemental or unfair to other classes of license. We would certainly be open to adding moderators to our team that hold other classes of license. We will certainly decline articles that are disrespectful to or prejudicial against other participants for any reason, including license class. We would prefer to judge ideas, and take posts at face value, rather than prejudge individuals and credentials in a vacuum."

Now that just speaks volumes about this man, his caliber, his "ethical standards", etc. Now, doesn't it?

Gawd! I feel sick ...

Warmest regards,
JS

Here is what my response to Mr. Schleck would be on his proposed moderated newsgroup:

Mr. Paul W. Schleck:

I would question your ability to be a fair and just moderator. I have participated in the rec.radio.amateur.??? newsgroups, I have witnessed your abilities and goals.

There, I have seen you and your extra class henchmen attempt to constantly steer the course of its' flow, intimidation and threats have often been your tools. I have watched you and others look down upon other amateurs who will now be allowed to take a "No Code Amateur Exam." In no way have I ever seen you be even close to being "fair" or "just" in your opinions, judgments, statements, etc. I have heard many in that group call the present amateur exams "dumbed down."

Here, you have blatantly lied as to your purposes. You seek a forum where a very limited band of ideas, concepts, beliefs and discussion can take forth. You seek to establish a "class based newsgroup", this class system will VERY MUCH depend on the ancient art of morse code and the amateur exam.

If any here doubt, they only have to sift though the old posts and check past posts of you and those you name as would be-moderators and they will know. What I say, I say with great belief.

You wish to establish a "masonic temple type of brotherhood" here in the public newsgroups. You and a few of your cronies wish to establish tight and strict control over this group. And, from what I can see and guess to your goals, you do this SOLELY for the purpose of stroking your own egos.

Many of the "weirdos", hecklers and vulgar individuals in the other amateur groups are due to you and those sharing your same views and using your "street smart" methods--in effect, your "control freak" attitude and "better-than-thou" stance has created them.

It would serve justice if you were forced to stay and learn to "get along and play well" with the other "children."

Your words show a fine demonstration of stealth and deception; I don't believe I have ever seen a better example than you have presented to us here. I certainly would nominate you for the "Silver Tongue Award."

However, I would certainly NOT vote to allow you to slink and sneak off from the tragedy you have helped to create.

Although you make this request and proposal out of your personal need to feed your ego, and surround yourself with those who would feed your ego for you, and "live in your own little world", I think it would be a crime to allow you to do so.

The potential you have to abuse this proposed-moderated newsgroup to the detriment of others demands it should not be allowed ... I for one would vote NO, but then, you already knew that ...

Regards,
John Smith I

I am looking for pcb template for little 80m DC receiver based on ne602
and lm386. (something like modified mrx40)

OK John, clean up this newsgroup so I don't have to add filters on an almost daily basis to eliminate the constant deluge of sex posts, vulgar posts, etc.

Dee:

There I agree with you 100%. The vulgarity and sheer non-sense makes me
embarrassed for them. I cringe at the mental state they must exist in
to wish to provide such a display in front of women and younger users here.

I fear that this does not just exist in the newsgroups, here with us,
but also is becoming "something bad" in America :(

I can only admire you in finding the tools and having the determination
to be here with us in spite of all that non-sense ...

Warmest regards,
JS

318. Re: Where does part 97 end and part 15 begin?

Its a good idea, might even make a fine commercial venture. My only
problem
with 160 to 190 khz is that its a public band, not an amateur band.

My reason for operating 80M under part 15 is that as a code practice
group
they can get used to courtesy and usage as well as operation, and
anyone
who happens to listen will simply hear just another group of brass
pounders.

Immediately after getting the license they can keep the same rigs but
then
start an amplifier project.

Another question would be temporary callsigns. I was thinking that
each kid
would have the call 15XX, where XX is the first and last initial.

I sure see lots of retired cell phones and wonder why I haven't seen any
homebrew projcts to make something useful out of old outdated ones.
I realize that the last few years may be too complex and small but how about
the old analog shoe phones?

Ww wow wow wow.... put the brakes on here a second.

There is a little flaw with that logic.

People do listen around the band, and type up the callsigns on websites/books/CD ROMs, and a lot of logging programs have callsign lookup, or at least rough location determination based on call layout.

There is never "just another group of brass pounders"

There is plenty of people that operate at levels of a watt or less, with the full knowledge that when they pound out a CQ a couple times, that someone, or sometime a bunch of people, will be looking through the band, hear them, and respond, so they can make a contact.

Local CW ops, and even some at quite a distance will quickly determine that there has been a flood of "very strange, illegal, but slightly weak people that don't do code very well" cluttering up a specific frequency, or cluster of frequencies.

Of course, the operator/s will subsequently have kittens, and all attempts to make ham radio operators look like a bunch of angles will go down the drain.

Of course the operator/s will try to get the group of "freebanders" to leave. If they don't listen, then the operator will do his solemn duty and he will get reinforcements, and the frequency will sound like world war 25 has just broken loose, pronto.

Them using random, made up callsigns will speed up the process, because there is plenty of people that cruse the bands, looking for rare DX. How do you think pileups happen? When they find a weak station using a rare callsign, it will hit the DX clusters, and all hell will break loose.

Heck, one of the groups that I always listen to on 160 had a little fun one time. One of them made a joke by saying that he was (something thousand miles) south east of anchorage Alaska. (ie) In Iowa. And all of a sudden, there were tons of people on the frequency asking where the Alaskan station was. And carnage issued. Some casual passer by had heard the Alaska reference and forwarded it to the DX clusters.

I can see so many ways that that setup could lead to total carnage in so many ways.

You will have some poor child asking his parents why someone would want them to stick such and such in up their tail end.

What you see is the FCC side-step the question. I do not believe they wish to take on the Indian nation. Indeed, I have heard of little success in any gov't agency in doing so.

Those treaties signed many moons ago by our forefathers still stand (Navajo, especially, have refused every attempt at revision), and they are very, very broad ... like gambling was probably accepted in all the territories back then. Like radio was NOT invented back then ... do you even know how large that reservation in question is? Try the size of West Virginia. Know how large that tribe is? Try the largest in the USA.

Some reservations have sent men to the best colleges and have some of the best attorneys in the world. If you doubt that, take on the Indians. California did, and lost ...

What kind of projects did you have in mind?

These days with DigiKey, Mouser, etc. it's often easier just to design
something from scratch, and that way anyone can build it (rather than trying
to track down a specific model phone...).

Would a call sign like PART15XX make it a lot clearer and a lot more
obvious? I wonder what the FCC would suggest for micropower
CW callsigns.

(Cough cough)..... yap!!!!!!!

I couldn't really think of a way to avoid a cataclysm that is why I ditched the idea of using the ham band, and especially the color burst frequency, without second thought.

The 3.579545Mc (Got a color burst crystal in my hand right now.) frequency is popular because the crystal is so readily available. So it's used in a lot of homebrew equipment. The crystal may be pulled up or down a bit in frequency, but within a few KC of that frequency.

You would basically be dropping them into a hornets nest of activity.

Any other alternative would be highly suggestible, even running relatively high power on the AM broadcast band would have less of a chance of stirring up trouble.

Another idea.
Going with off the shelf CB's would also be an idea. You could use a code practice oscillator held close to the mike, or even wired into the mike circuit, to send code practice. You could even implement digital transmission systems via a computer, program, and sound card (RTTY, PSK31, MFSK) if you wired the soundcard output into the mike. It would work perfectly fine on Stock AM. Only one person could use the frequency at a time. It wouldn't exactly match the designed method of operation, but it would work. It would get them familiarized with the modes of operation.

If you spent the money on SSB CB's then you could fully implement the intended method of operation for soundcard/computer based programs. And it would allow multiple people to carry on a PSK31/RTTY/BPSK/MFSK..... conversation on the same channel without bothering each other. Basically the same as you would have on the Lowfer band. And you wouldn't really have to build a thing except for a few audio interface cables.

Just get a bunch of SSB radios, the cheapest ones you can get. Wire up a bunch of interface cables to hook the mike, and speaker connections to the sound card, and you are done.

You could also set up a packet network with CB's. Other people have done it.

You could even implement the newest DRM transmission systems that are hitting the ham band if you had SSB CB's.

And the CB band is relatively dead right now, so you have plenty of open channels to work with.

And you can use off the shelf antennas, that are a lot smaller. It would also open up the realm of mobile operation.

There is plenty of options, besides putting them in a situation that is just asking for trouble.

.....
.....

A little note to add to that, in case someone thinks that no one will hear a station at a distance that is running real low of power.

A few weeks ago, I was playing with an oscillator design. I had just used a random inductor that i had laying around for the LC network. The frequency that it landed on was totally at random.

That happened to be around 8.199Mc

All that i had hooked to the proto board was the power supply, and the frequency counter, (and sometimes the O scope). The oscillator was developing about a 8V P to P signal across the 1Kohm loading resistor on the proto board.

I wanted to have an audio representation of the oscillator drift, so I went to my normal HF receiver and tuned it in on the SSB setting so i could hear the drift in real time.

The oscillator was being pulled by the frequency counter a bit. When the gate of the counter would open, the oscillator would shift down a hundred cycles or so. The audio signal I was hearing was along the lines of ... drrrrrrrrrrr duuuuuuuuuuuu drrrrrrrrrrrr duuuuuuuuuu.....

I had a reason to turn it off for a minute, and then when i turned it back on, i heard a Burlblbublbublbub ..... for a few seconds, then it went away, for a few seconds, then it went Burlblbublbublbub ..... again, and then went away..... I thought that it was totally by coincidence. There was no way anyone could be hearing it.

So, to settle my mind, that I wasn't going crazy, I shut off the oscillator again, for a few minutes. I never heard the unknown signal in that time. But when I turned the oscillator back on..... About two seconds after i turned it on..... Burlblbublbublbub..... then a few seconds later..... Burlblbublbublbub....

After subsequent test cycles I had pretty much figured out that it was some kind of frequency hopping signal that I was hearing. The signal from my oscillator must of correlated closely with the type of contact initiation signal that the outside station was looking for. When it heard that warbling tone, it would try to interrogate the calling station (my oscillator) to set up a two way contact. It would try two times, then give up until the signal disappeared for a certain amount of time. When the signal would come back, then it would try to set up a two way contact again

I looked up what band the 8.199Mc signal fell in, and my old reference book said it was a maritime mobile band. The data in the book may be out of date, but if it isn't, then the receiving station may have been a long ways away. Probably some automated ship to shore station along the great lakes. The propagation was just right for my signal to hit their receiver.

Stuff like that is why direct antenna coupled regenerative receivers that are operated in the oscillation region for CW/SSB detection are frowned upon. If they are hooked to a good antenna, then your "receiver" can be heard quite a distance away.

That is why most regenerative kits sold today, have an RF amp stage on the input, to stop the regenerative section from back feeding the antenna.

I have even heard of a few people using a regenerative receiver as a transceiver by keying the tube with the regeneration control turned way up. They only made contact to people on the other side of the island, but it worked. Now try to beat that, a one tube or transistor transceiver!

Some of the analog shoebox and suitcase phones have separate VCO
modules and IF strips. The chips used were sometimes well-documented
(I'm thinking of the Signetics and Motorola stuff) and the datastreams
for microprocessor control you could figure out.

But you have to go back to the early 90's to find equipment of that
era. There were some ham magazine articles at the time these were
going surplus. Some of the equipment had diagnostic modes that let you
turn them into simplex receivers - not very good quality but OK and
their reach outside the cellphone spectrum was nearly nonexistent.

Just to make you jealous: I work just two blocks from where the
original actual shoe phone now resides :-). I am trying to persuade my
company to get it from them on inter-agency loan...

Tim.

It always surprises me how little useful I can get out of these. I used half the diplexer from a big old one as a filter for an 875 MHz local oscillator chain for a 903 MHz receiving converter. And I used the speaker from a more modern one to provide sidetone for a laser MCW transmitter. That's it so far....

1. Ok, easy question first. Someone has given me a PCB for a QRP transmitter called "little joe" and the PCB has 9-81 QST. I have searched on the web but I cannot find the component layout, and, ideally, a copy of the original article.

2. I have been playing around with a simple transmitter project called the Michigan Mighty Mite (http://cs.okanagan.bc.ca/ve7ouc/eng/kc6wdk-mirror/transmitter.html) which uses any one of a number of small signal NPN transistors. As I found a large number of metal cased NPN power transistors, I was wondering if I can drop one of these as a direct substitute for say, a 2n2222, or an old BFY51 etc etc. I have, for example, found a RCA 2n6282 Darlington Pair in my junk box. This is a VERY meaty little beast. The datasheet for this tranny can be seen here:- http://www.datasheetcatalog.com/datasheets_pdf/2/N/6/2/2N6282.shtml

Any suggestions?

That's true. They sent one kid off to MIT and he came back with a degree in Electrical Engineering. When he got back home he found that the communal restroom had no lights, so to show his gratitude to the tribe he ran electricity to the bathroom.

So far as we know, that was the first Indian ever to wire a^head for a reservation.

The big clunky ones, and I've not seen any at garage sales in a few
years, have offered up things like FM IF strips (they've tended to
be really easy to isolate from the rest of the unit), various crystal
filters with centre frequencies above 30MHz which would be suitable
as roofing filters, some txcos, go back far enough and they have
standalone NE570 (or later variants) compander ICs. I've also pulled
prescaler ICs out of them.

The trick is that the older and bigger they are, the better the parts.
There will be recognizeable parts, and many will even be in DIP packages.

The more recent they are, the less valuable because everthing gets
highly integrated. I opened one hand held cellphone, of recent
vintage obviously, and the IF filter was barely recognizeable.

Because they were specifically designed to be part of a system (ie
you'll never use a cellphone by itself), they have usually been
way too dedicated to allow for much in the way of modification.

Don't do it!

Power transistors, particularly vintage ones, are very slow in
comparison to "small signal" types. Darlingtons are a different kind of
thing altogether, they are even slower yet but with significantly higher
current gain.

Find a bag of surplus 2N2222s, or buy a dozen new 2N3904's from Digi-Key
-- you'll be much better served.

The Dine' (I use the term Navajo because most people outside are
more familiar with that) are a very proud people who would resent
being made fun of like that.

To the Dine', we are an alien people out of touch with the
rhythms of the land, who are obsessed with consumer goods,
technology, money, or bigotry. Even such whites are ourselves
who do see what history has done to the Dine' and find it
appalling, are viewed as possibly having egotism.

The Dine' are more impressed by whites who listen first then
act later in small ways that fit what the Dine' already do.

You have to live with the Dine' least a couple years before you
can even begin to understand the challenge of introducing a
new technology in a culturally appropriate manner.

ES:

Yanno, that is something which is easy to provide high respect for in your description; which, by the way, I consider to be highly accurate.

Several years ago now, I was assisting to put together a data base for "prediction" of IQ's. One classification we correlated the data to was race (I know, un-politically correct, techs are that way.)

I was nothing short of amazed to find the most intelligent race on the planet, per capita, was the No. American Indian! (when given a "flat test", and adjusted for cultural differences--or, only based on ones ability to "solve puzzles.") That research indicated them best fitted for such tasks as research and development, the theoretical sciences, (and yes) law practice, etc.)

My prejudices, possibly from old westerns?, were so firmly set, I kept searching for a mistake in the software ... in other words, was hard for me to NOT picture them with a "bottle of firewater in their hand." I know, I have made mistakes in my thinking, and that ain't the only one!

I learned something ... in the end.

Regards,
JS

Just a follow-up, maybe someone finds it useful. I found 4 links for
Ottawa, Canada (in addition to digikey):

http://www.alliedelec.com (online only)

Gervais Electronics Retail Walk-in
#1 - 716 Industrial Ave., Ottawa, Ontario, K1G 0Y9
Toll Free: 1-800-267-2742, Phone: 613-738-3101, Fax: 613-738-1188,
Email

Active Tech Electronics Retail Walk-in
1023 Merivale Rd., Ottawa, Ontario, K1Z 6A6
Phone: 613-728-7900, Fax: 613-728-3586

Reset Electronics Retail Walk-in
1050 Baxter Rd. Unit 10,Ottawa, Ont., K2C 3P1
Phone: 613-596-5544, Fax: 613-596-9079

Hope it helps someone.

Speak for yourself. My grandmother was of the Crow Nation and it has been my observation that most evolved peoples have a sense of humor. You might consider getting your panties out of a wad and lightening up a bit. I ain't any happier than you that my ancestors gave the First Nation the smelly end of the stick, but we both know that time moves forwards, not backwards. It is what we do OURSELVES that we are accountable for, not the sins of our forebears.

I had teachers like you growing up ... sheesh.

Very well.

Andrew,

A few thoughts about your idea and some of the responses that it has evoked:

First off, I don't think your emphasis should be on transmitting. To me, ham radio is about communication, and communication, first and foremost, is about LISTENING. Listening is what you should emphasize.

Since there are both physical laws of nature and interference (natural and man-made) to contend with, the real magic in radio is the antenna, amplifier(s), filter(s), and operator techniques used to extract useful information from a feeble signal. (Case in point: Voyager 1 is now more than 9 BILLION miles from earth, but as long as its flea-power transmitter holds out, we expect to be able to continue receiving data.)

There is great fun in building simple receivers, and much to be learned. A few years back, for lack of something better to do one evening, I knocked together a regenerative set on the bench top in the garage. I wound a coil on a toilet paper tube, made a grid-leak capacitor out of a couple of microscope slides and some foil, and hooked up an old #26 tetrode. The rig was "wired" with alligator leads and powered by flashlight batteries. The antenna was 15 feet of wire thumb tacked to the garage ceiling, and the ground was a 'gator clip attached to the cover plate screw of a nearby outlet. A few adjustments later and I found myself listening to a radio-theater presentation of "Dracula" put on by the BBC in London. That's more than 5000 miles from where I live. That's magic.

In your case, a FET based regenerative set would be the ticket. Dirt cheap and effective enough to be useful. (I'm thinking something along the lines of 1 FET RF/isolation, 1 FET regen stage, and an LM386 amp chip, which will easily drive common walkman-style headphones.)

If you want to teach your kids Morse, use the Code Quick method. Buy a copy of a program called Numorse for yourself, and use this to generate exercises for the kids. You can put the audio on cassette tape or CD's. When they get up to 5 WPM or so, you have them listen to W1AW. The day after a W1AW session you ask the kids some specific question about the text that was sent the previous night. Offer prizes or some kind of encouragement for positive responses. Once they can receive Morse, learning to send is rather easy.

This is something of a detour, but have you ever heard recordings of sounds the Ionosphere makes? Remarkable chirps, whistles, clicks, and pops. Slow down the recordings and you get sounds that are startlingly

similar to the songs of certain birds, or the calls of whales. The equipment to capture this is cheap and easy to build. This is one situation where a remote location is a real asset, because there is far less man-made electrical noise to foul your recordings. Get a kid hooked on something like this, and who knows what kind of scientific or technical career could develop from this experience.

If you insist on transmitting, or equipping your students to transmit before they even have the skills to do so properly, fine, so long as you are certain that your activities are within the boundaries of the law. With regard to the comments of some in this thread I will simply say that the last thing society needs is a "mentor" whose first lesson will essentially be: "If you don't like the rules just ignore them." I am of the opinion that the preponderance of this attitude is responsible for much of the unhappiness in this world.

Final thought. I few years back I authored a book on the subject of primitive radio, and how to build radio components from scratch. This includes homemade variable capacitors, tuning coils, detectors, and even headphones. The equipment is built with hand tools and made from such mundane source material as wood, tin cans, cabinet magnets, and cigarette lighter parts.

Web link: http://www.hpfriedrichs.com/bks-votc.htm

This book has been critically acclaimed by the editors of QST and Practical Wireless in the U.K., and is recommended by at least one teacher's guide:
http://www.libraryvideo.com/guides/N7003.pdf?mscssid=B7EATDCXALG28J0F5NE5J92CHF5S8T4A

I am sensitive to educational and charitable concerns. If you should express serious interest in using these in a classroom setting, we could discuss how to make this happen.

I sort of said something along the same lines, though maybe it's not
apparent.

The idea of something more open-ended seems more important than a funneling
into something specific. I don't think anyone could see anything wrong
with getting the kids interested and even excited about science
and technology. But how you get them there can be a mystery. Somethingt
sparks an interest in one child, and not in another. The goal can't be
about the kids getting a ham license, it has to be the benefits
they might get from being involved in the hobby. And there are all
kinds of things that might provide similar benefits, and might suit
the kids more than spending time preparing them for a ham license. The
effort might be better spent on getting them interested in something
that fits them, and letting that be a vector for learning.

Too often, adults forget what it's like to be young, and they use
adult notions in trying to interpret the young. So often there is
the "kids today aren't interested in science" yet if they aren't
given the chance they never will be. And of course, science was
never something belonging to all. Building that regen receiver
and getting it working should be as much of a challenge and thrill
as it was back when I was young, because it's not about having the
receiver (which won't compare with something store bought) but that
you built it yourself.

I threw together a stepping motor, diode, "super-cap" and LED to make a
crank flashlight a couple of months ago. I'm still trying to remember where
I put the other supercaps I took out of VCRs, because there wasn't enough
capacity. But I was making it to show the daughter of a friend, who is about
the right age to appreciate that such things are in the realm of making
yourself. It doesn't matter that you can buy such things pretty cheaply
now, it matters that it conveys that such things don't just grow on trees.

If we aren't doing this sort of thing, conveying that we are intrigued by such things and showing off how it's not a black box beyond our control but something we can put together from scrap parts, then there's no chance that the young will become interested in science and technology.

The CK-200 Keyer features a Curtis 8044 ABM Keyer Chip with adjustable
weight and tone, volume and speed controls, and dot-dash memories

The CK-200 manual (Adobe Acrobat) on the Vectronics web site -- is DAMAGED.
Please contact Vectronics directly concerning this issue.
http://www.vectronics.com/manuals.php

eHam.net reviews of CK-200
http://www.eham.net/reviews/detail/1131

Here is the 8044 Application Notes - by John Curtis (circa 1992)
This should get you 90% there - since most designs were based upon John's
notes!
http://users.ox.ac.uk/~malcolm/radio/8044screen.pdf

8044ABM. This final keyer chip was introduced in the spring of 1986.
It incorporated selectable A or B modes and the speed meter.
This truly was a top of the line chip, and became an industry standard.
However, as microcontrollers debuted in the '80s and PIC processors in
1990s -
the Curtis chips were no longer in demand. John stopped selling them.
MFJ / Vectronics purchased the 8044 line and now offers an improved 8045ABM.
Curtis ceased operations April 1, 2000.

The "Little Joe" is actually Wes Hayward's W7ZOI Universal QRP Transmitter.

Go here for parts and schematic: http://www.qsl.net/k0kp/hbrew/qrp_tx.html

As for part two, in comparing the two datasheets, I don't see all that much that is similar between the two other than they are both NPN. You could try it though. If it doesn't work, a handful of PN2222's can be had for less than a couple of bucks.

358. When is a hybrid not a hybrid?

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-01-31 15:08:53 UTC
From: Ian White GM3SEK <gm3sek@ifwtech.co.uk>
Message-ID: <Jxv0GDRFELwFFAt9@ifwtech.co.uk>
Source record: 8747

Someone has asked my magazine column where the name "hybrid coupler" came from; and why do some people reserve the name "hybrid" for only certain types of couplers?

That isn't as easy a question as it first seems. Everybody seems to talk about "hybrids" but few authors are prepared to define exactly what it means - much less explain why.

The following is a draft outline for my magazine article. It looks much more authoritative than I actually feel about the subject - especially about the origins of the term "hybrid", so I would welcome any comments...

Hybrid is originally a biological term for a "cross-breed" that inherits different characteristics from two different kinds of parents. The word has then taken on a much wider sense - for example, we talk about "hybrid road vehicles" or "hybrid analogue/digital systems".

However, a "hybrid coupler" is a much more specific term, which came from the early days of landline telephony. Originally, a two-conductor line could only be used in one direction at a time; but with a hybrid coupler [Figure] at both ends, that single line can be used for full duplex communication in both directions. An important feature is that the coupler provides isolation between the links in opposite directions [insert more description here, including bidirectional amplifiers].

So why was this device specifically called a "hybrid" coupler? There's nothing particularly hybrid about the coupler, so my best guess is that the word originally applied to the communication link - the bidirectional offspring of two unidirectional parents. But in the strange way that technical language evolves, "duplex" has become the common word for a bidirectional link, while "a hybrid" has come to mean the coupler itself. The same word has then been applied to RF couplers that share some of the characteristics of the original telephone hybrid.

The best descriptions of RF hybrid couplers I've been able to find on the web are in:
http://en.wikipedia.org/wiki/Power_dividers_and_directional_couplers
and:
http://www.rfcafe.com/references/electrical/directional%20coupler.htm

In RF engineering the name "hybrid" has become attached to the 4-port coupler in [Figure]. When ports 2, 3 and 4 are matched, the input power at port 1 is divided equally between ports 2 and 3, with a phase shift of 90deg between the two output ports. Since half the input power appears at each output port, the transmission loss to each individual

port is 3dB, so this device is sometimes called 3dB coupler. The reason why this device is called a hybrid is because of the port-to-port isolation it provides. In the matched condition, ports 2 and 3 are isolated from each other, and port 4 is isolated from port 1. [Add more details of the 3dB/ 90deg/quadrature coupler configuration.]

However, the Wikipedia author(s) also point out that nowadays "any matched 4-port with isolated arms and equal power division is called a hybrid or hybrid coupler." This wider definition also includes 0deg hybrids and 180deg hybrids, in addition to the original 90deg variety. Some 3-port devices are also called hybrids because they provide isolation between the output ports and have a 'virtual' internal 4th port, an example being the Wilkinson 0deg power divider.

Of course, some devices that do not meet every part of the above definition may still be called "hybrids" in practice. And a device that offers port-to-port isolation is likely to have other names as well, eg it may be called a "bridge". Are we confused enough yet?

Originally all these definitions were also restricted to passive linear devices, but as op-amps get faster and faster, and move up into the RF domain, it becomes possible to create the same port-to-port behaviour using active devices. It is now possible to build active hybrids that can operate up to at least 100MHz, and their advantage over transformer-based hybrids is that they have no lower-frequency limit. However, any hybrid still has to be a linear device.

[More to add...]

How does that look, as a first draft? I would particularly appreciate comments on the probable history of the word "hybrid" in telephony and electronics.

> than a couple of bucks.

BG Micro has the metal ones, that you tend to use in the final, for a quarter, the plastic ones you use for anything else for 6 cents. They have surface mount MMBT2222A's for 4 cents.

2N2222's are handy little transistors that show up everywhere, and any time you need any old NPN, a 2N2222 will generally do, so it never hurts to have a few hundred in the parts drawer. And at $6/100, it doesn't hurt the wallet all that bad, either.

Of course, BG shipping to merrie auld England probably isn't all that pretty, but Farnell or some other local supplier must have something comparable. I'm sure there must be a BC equivalent ... I bet if you found the cheapest NPN it would be the same thing. You might shoot off a note to George or Ian, or perhaps take a peek at the G-QRP's Circuit Handbook. They seem to love the daylights out of the BC108, so I bet it is comparable (although I don't have any data on that to compare).

HP,

The whole point of my original post was to see if forming a micropower net on 80M COULD be done within the rules. I would indeed be a poor mentor
for encouraging students to break the rules... and I never advocated such. Please speed-read what I post a little slower next time :)

Today I make my first presentation, and I have a pretty bad cold. I don't have any Mr. Wizard exhibits put togther, just the equivalent of a slide show plus a few parts, because I only have a week's notice.

I am changing tack and taking my radio with me to the classroom, if the students are really interested I will lend the classroom my rig until
a replacement can be build or bought, and be with them for a couple hours per week as control operator. The science teacher has promised it could be connected outside to a wire antenna of some type if at all possible.

So wish me luck, and please use my handle on Usenet rather than my name from now on. I'd rather not be made by some determined lunatic intent on causing me or my family any harm.

Well, I did try to build a regenerative receiver to demonstrate to the
class,
but I couldn't get regeneration. Shall I mail it to you to see if you
can debug it?

Thanks,

Not cheap, but the horse's mouth is:

http://www.bwantennas.com/coils/aduxacr.htm

I have been getting glass-epoxy or phenolic tubes (good place: www.mcmaster.com
) and winding mine from rod/wire lately (silver plated in some
cases... learning how to silver plate myself too!).

Tim.

Hi Ian,
A hybrid coil in telephony was (is?) used to couple a 2 wire
line to a 4 wire line allowing bidirectional amplification. If you
have access to Reg's old bible _Communication Engineering_ by William
Everitt you can read an explanation of how this works starting on
page 317 (second edition).I suppose the term "hybrid" refers to

the fact that two different types of line (2 wire and 4 wire) are involved.
From _Microwave Engineering Using Microstrip Circuits_ by Fooks and Zakarevicius: "Hybrid couplers may be regarded as directional couplers which can produce an equal power split between the output ports. This definition is good in the main, but it is possible to have hybrids with unequal power split. Inherently, a hybrid and a directional coupler are the same type of device. The only difference is really one of construction, with the hybrid-line coupler historically arising out of structures which aimed to produce equal power splitting with good isolation, directional coupling aspects not being of interest."

Looks like I have a reprieve. Today is considered a half day for
student due to snow, so my presentation got cancelled. Which
is a good thing too, cause I'm quite unprepared for it.

Being the only Extra, let alone ham, in the area is a very
overwhelming feeling.

This whole thing needs to be rethought anyway. If anyone
has bits and pieces of working homebrew I can borrow,
say yes here and I will contact you privately. My own
homebrew is just not working today worth a darn.

Hi Brian .... I think I've seen that call on QRP-L or maybe the Microchip forum.

If you're willing to ship to mister35mm and you got 'em for $6/100, $1/5 in the TO18, that's pretty darn hard to beat

..

Hi Ian,

Hybrid in biological terms I believe means that it can not reproduce
itself. Plants from Hybrid seeds can only be grown from the original
seeds.
I would guess that the relationship to the hybrid coil would have to
do with the isolation between ports,,, can't be reproduced from port
to port only from the original or single port.

Squire,

With all due respect, you need to re-read *my* post. I never accused you of anything. Rather, I indicated up front that my comments were directed both to you and to others in this thread, some of whom have advocated an "it is easier to get forgiveness than permission" point of view. I think you've agreed that this is not appropriate for a mentor/teacher/role-model.

Squire-

I'm going to take your comment on face value and assume that your receiver is indeed functional but for lack of proper regeneration. If this is the case, I would guess that the most common cause of this kind of problem is improper phasing of your tuning/ticker coils.

It would help if you could post or point to a schematic from which you worked, but let me suggest this. Lift both leads from you tickler winding and then swap them. This may be all it takes to fix the problem.

BTW: Check out this simple receiver by Charles, N1TEV. It follows, more or less, the architecture I proposed, and apparently works well. PCBs are available.

375. Re: Vista compatibility with APRSPoint

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-02-01 01:59:51 UTC
From: JDB <me@here.now>
Message-ID: <45c14997$0$5742$4c368faf@roadrunner.com>
Source record: 8514

The problem with APRSPoint is not the operating system. The problem is that the author and seller of the program does little to enhance the program. It does not meet the APRS spec and lacks functionality that is much needed to make this a full functioning APRS program. The author also sponsors a "support" group on Yahoo Groups. The problem with him and the group is that if you say anything critical of the program the author censors the post so no one else will get a bad impression - or should I say honest impression of the APRSPoint program. Be advised, until he starts fixing and enhancing the program and accepts honest feedback in his forum, stay away from this program. You can use AGWTracker, Xastir, WinAPRS and UI-View.

hxc98@yahoo.com wrote:

The data sheet hints at DC to 58MHz, interesting little chip with Gilbert cell AGC and differential inputs and outputs that can also be used in single ended configuration.

Since I started scrapping old F/H 5-1/4 hard drives that were laying about and forgotten I've found that some of these use this chip, I've liberated a few so far.

Hello Ian and Tom,
The mention of "Communication Engineering" by William Littell
Everitt sparked my interest since it has prime occupancy on my
Basics bookshelf space (the book and I were "born" in the same
year...:-)
Going into the etymology of *ALL* "hybrids" in communications
will probably focus not on "radio" but the common telephone
handset and the long-distance, wired telephone system courtesy
of remarkable innovation by the American Telephone and Telegraph
laboratories. Note: I'm not waving a flag for "Americanism"
only that the AT&T system grew to be huge early-on and also
engineered for rather incredible longevity and good performance.
The common telephone set made here by the MILLIONs between
the 1930s and 1970s period all had a "hybrid transformer" as its
basic "coupler" to the telephone line, here a 2-wire balanced-
pair to the central office. Mouthpiece and earpiece were
actually isolated by this "hybrid" with a controlled leak-
through to the earpiece for "sidetone" (a term that came from
telephony as well). In addition, the "hybrid" coupled or
isolated the 40 VDC (give or take) always present on our

telephone lines and the 20 Hz Ring signal (with/without the hook switch cut-out). Added to that were a (somewhat) primitive "ALC" using thermistors-varistors to keep loud talkers from blasting ears of other users. Rather complex arrangement but very simple in terms of parts, rugged, long-lasting (better than 30 years life), and cost effective.

It would seem that the POTS hybrid scheme grew out of long-distance lines' repeater stations where two amplifiers were needed to boost signal strength both ways...AND provide a DC path for lots of different telco service needs. The concept of linearity through negative feedback was a direct result of "long-lines" repeater needs. A long-lines repeater "hybrid" seems to have evolved from the already-existing bridge circuit used for measurement of passive components. I say "seems" because both repeater hybrid and measurement bridges are configured for balance and "separation" of the components' characteristics. All of that took place at "audio" frequencies (under 15 KHz), including frequency-multiplexed SSB voice channels. Yes, "SSB" was pioneered by the various telephone companies in the world, on wire lines first, then on "radio." :-)

Segue to World War II and some massive head-scratching on both sides. "Radio" folks of older days may have encountered a "Magic-T" in waveguide, particularly at X-Band (3 cm or 8 to 12 GHz). A Magic-T is really a hybrid transformer equivalent, RF energy coming into a common port (inbound) is relatively isolated from RF energy into a 3rd port intended to go outbound. The fourth port is generally terminated in a resistive load for broadband balance but can also be used as a bidirectional port. "Isolation" is a result of good directional balance, a term that became common in the microwave field after WW2 and Isolators and Circulators came into being. Note: A "circulator" performs the same function as the old Magic-T but has a greater production yield, generally more compact.

The "rat-race hybrid" of all-coaxial lines probably evolved out of the Magic-T as a semi-broadband hybrid transformer but at RF lower than microwaves. It had limited use until Stripline and Microstrip was innovated. Most Rat-Races are still rather narrowband and incapable of working to octave bandwidths common to microwaves.

With Stripline a whole vast array of "flat" configurations were innovated but all based on basic transmission line properties...including all the filter structures built entirely on PCBs.

Broad-banding at RF also had to wait for better powdered-iron and ferrite materials' better characteristics that came about after WW2. One offshoot of that was the broadband RF transformer that could have double decade bandwidth. Such RF transformers could be configured very

much like the old POTS hybrid transformers. :-) Variants of those appeared in HF through UHF solid-state power amplifiers and "hot plug swapping" RF power amplifiers composed of many modules, each relatively isolated from one another. Does anyone working at RF not know about the "balun?" [broadband impedance-changing/isolating transformer]
It is my opinion that many, many terms became a sort of jargon or "tech-speak" for the simple reason of the names being short yet familiar to all working with a particular field. For example, it is much easier to say and pronounce "flip-flop" than the formal name of "Eccles-Jordan Bistable Multivibrator." :-) Folks in radio say "mike" for microphone or for microfarads of capacitance; what they are talking about does a subtle unconscious separation and ordering of the incoming information. There isn't much confusion about such jargon even if discussing 'condenser microphones.' :-)
Sometimes the jargon becomes over-used. I use the term "Wilkinson Power Divider" [or "Power Splitter"] for a familiar Stripline structure, yet I've heard and seen it described as a "Wilkinson Hybrid." While it is on the grey area of veddy proper useage, most RF folks know what either is. Editors writing for a large, unknown-technical-smarts-set readership do, understand-ably, get a bit under stress trying to Explain It All. [been there, done that, got a few T-shirts...:-)]
I would trace "hybrid" in electronics all the way back to the guy that invented the "Wheatstone Bridge." Wheatstone spoke and wrote about that clever thing so much that His name got stuck on the configuration, the real inventor's name got rather lost. Balance and isolation were essential there...and balance and isolation was necessary in the telephone "hybrid." Millions of telephone "hybrids" later, the jargon happened. The "hybrid" essential principles were applied to other fields within electronics and the rest is slightly confused history...:-)

Cheers,
LenAnderson@ieee.org

MC1350s are still being produced (!) and can be bought
from Jameco...www.jameco.com...$1.95 each, $1.85
quantities of 10. Jameco's catalog 271 has them as
"audio amplifiers" :-)

Those are the plastic-packaged offspring of the original
Motorola MC1590, intended for any sort of RF amplifier-
with-DC-gain-control from low AF on up to 70, 80 MHz.
Differential input, differential output, gain control to
beyond 50 db, very good constant input impedance on
each input side. Open-collector on output so there is
good flexibility in its load configuration. Turns out they
also make good limiters.

Quick, simple question:

Would a normal aluminum can be any good for RF shielding of a balun, or
would it for some reason not work? Should I connect it to ground?

And;
What does a transmatch do for me that a normal balun/transformer won't do
for me?

Thank you for your time.
Sincerecly,

Thank you, but most of the thanks should go to a gentleman at the Signal School that was in Fort Monmouth, NJ, back in 1952. He had spent a lot of his work time at Bell Labs. My MOS was Microwave Radio Relay in the Army and had to encompass comms techniques from landline telephone through radio at VHF to microwaves. Even more to a couple of GE technical reps who oversaw the installation of 24-voice-channel 1.8 GHz radio relay terminals in Japan '54 to '56. They had the knowledge at their mind's finger-tips and infused a number of us back then with some indelible information. :-)

If you wish to see a bit more of 50-year-old military communications, download:

http://sujan.hallikainen.org/BroadcastHistory/uploads/My3Years.pdf

It's about 6 MB and takes about 20 minutes on a dial-up connection. Hal has a lot of information collected there, not all of it on broadcasting.

Well IF cans are made of aluminum so I would think a can would work
fine. Normally one should keep the walls of the can some minimal
distance from the coil windings. IIRC the radius of the can should be
something like 2-3 times the dia. of the coil.

OK OK boys... yes I know 2n2222's are wonderful and plentiful, but I have a heap of geriatric bipolar power transistor I thought it might be worth experimenting with:-

2n3055 (three)

2n3054 (four)

2n3739 (two)

2n4800 (one)

Sony D292 U38 (two)

Sony 2sc895 (one)

I thought if you can get anything up to 500mW with a general purpose NPN, then what can you get out of an old power transistor?

I also have a load of BD139 medium-power transistors...?

Any thoughts?

In addition, I am still looking for the COMPONENT LAYOUT for the PCB for a QRP
transmitter called "little joe" described in 9-81 in QST. I am not looking for just the circuit diagram but where the parts GO on the PCB!

I believe that I've read that the distance from metallic objects
should, at a bare minimum, be at least 1/2 the coil diameter. So that
means 2 times minimum, giving 1/2 of coil diameter around the sides.
3 would be much better. Aluminum is good shielding material; onlt
thing better would be copper (or silver).

As is so often the case with word/phrase etymology, origins are
sometimes cloudy. The wikipedia article alludes to this. But I
believe the key is that the two outputs are equal in a so-called
"hybrid". You might simply tell your readers in summary that the
issue is unclear, and that you gave it the best shot anyone reasonably
can.

Guess I came up with a rather cheap alternative then. :D

Think newspaper, or any other kind of paper, would be good filling material to isolate the transformer from the aluminum can?

There are two things to keep in mind when you put a coil in a can.

1. The inductance will decrease due to the reduced voulme for the
magnetic energy. This is the same effect as using a brass slug to
change teh inductance of a coil for VHF applications.
2. The losses will increase due to the induced currents in the walls
of the container.

The further away the walls are the lower the effect. The various rules
of thumb you hear are just the result of someone determining what is
acceptable.

What happens is that the metal acts as a shorted turn which absorbs some
of the current flowing in the inductor. A brass slug core inside the
coil takes advantage of this, the closer to the center of the coil the
greater the effect. The result is both a lowering of the inductance and
probably the Q. An effective way to tune vhf-uhf circuits, but a
shorted rotary turn was also used on the hf bands in "olden" days.
In the case of small tightly wound inductors with iron core slugs
the coupling from the shield can to the coil is rather small (ratio of
the turns and inductance) so the effect is small.

Alas, on the wretched hour of Sat, 03 Feb 2007 08:29:40 -0700 James M. Potter thusly proclaimed:

> There are two things to keep in mind when you put a coil in a can.
>
> 1. The inductance will decrease due to the reduced voulme for the
> magnetic energy. This is the same effect as using a brass slug to
> change teh inductance of a coil for VHF applications.
> 2. The losses will increase due to the induced currents in the walls
> of the container.
>
> The further away the walls are the lower the effect. The various rules
> of thumb you hear are just the result of someone determining what is
> acceptable.

Ah, so if there's lots of noise where I put my transformer I'm better off taking a small hit to signal strength to still improve my s/n ratio, but if there's little noise I'd just be canceling out the weakest signals... Guess I'll have to try it with and without the can then to see if I've got lots of noise here. :)

Thanks for the reply.

a cheap ready-made lofer coil is right in an old junker tv..the horizontal output coil usually has a ferrite adjustment for frequency (horizontal hold)... put another one in series with your 50 foot antenna, and tune that as your load for increased output. I bet you can even use one for a cheapie regen radio down there too...Hmmm time to visit the dump..
.....

The problem with power transistors is that they are big, and all other things being equal, more size spells more capacitance, and mosr capacitance spells more trouble at higher frequencies.

Chances are, you might do some good with some of them on 80, but you're not likely to make them play nice on 20. If you notice, the 3055 has an Ft of 2.5 MHz, 3054 3 MHz. The 2N2222 has an Ft of 250 MHz, so you can see there's a little difference there.

Your 3739 has a 10 MHz Ft, so you might get a little gain out of it on 80. The 2SC895 I *think* is 20 (could only find a bad copy of the datasheet). It will take a fair bit of tinkering to make parts like that work at all, and they won't work well.

..

> There was also the MC1351 which was a 'hotter'chip with more gain

...and the MC1349. But, Lansdale bought the rights and
production "rubyliths" to the 1350 and either ON Semi
or Freescale (the splits of old Motorola Semi) indicate
they are still production items.

The 1590-1350 and variants are output-open-collector,
therefore their individual stage gain is a function of the
load impedance. You can get an easy, stable, wide-
band gain of 30 db plus, all the way out to 60 MHz.
Input impedance is a constant 5 K in parallel with 5
pFd each input, easy to deal with since it isn't that
sensitive to output loads.

The current gain drops to unity at fT, but you might still get some
voltage and power gain around such frequencies in a common base
configuration. This is the case in many microwave bipolar amplifiers,
since you can not get transistors (or would be too expensive) with fT
sufficiently high for common emitter configurations on a particular
band.

However, I have not seen common base amplifiers for HF, since RF power
transistors with sufficiently high fT are easily available for HF.

Pasternack has the plugs, although they are sadly not cheap. I got a TMC
receiver a couple years ago that had been demilitarized with a boltcutter
and wound up having to buy a bunch from them.

Ok then.... I give up.

I had checked out the maximum frequency on all these old bipolar power trannies, and basically, I've stuck them on ebay.

I seem to have quite a few BD139 power transistors. They are not as 'meaty' looking as they are medium power, plastic cased and are not small signal types.

Looking at the data sheet here:- http://www.ortodoxism.ro/datasheets2/6/0rwiehk82adehe25p4gkxjros2yy.pdf

It say these transistors are good up to 190MHz, so does this mean I can use one instead of a 2n2222 (I have lots of these BD139's and if they'll work, I'd like to try)

Would I have to change any of the component values of the Michigan Mighty Mite (http://cs.okanagan.bc.ca/ve7ouc/eng/kc6wdk-mirror/transmitter.html) component values to use a BD139? Say 1/2 or 1 watt resistors?

Mostly the receivers are direct conversion or low-IF (hundreds of kHz) these days, and the IF filters are active R-C filters on chip (then come the ADCs, followed by a DSP channel filter).

If you find a phone which was built 3 or more years ago then you will probably find a couple of quite high performance (good phase noise) Voltage Controlled Oscillators on little PCBs in metal cans. These could be re-used if the frequency is right for what you need (one will be in the transmit band of the phone normally, and the other one might be at a strange frequency). In phones from the last couple of years, those VCOs are all on-chip.

In GSM phones more than a year old, there will very likely be a good quality Temperature Compensated Voltage Controlled crystal Oscillator (TC-VCXO) at either 13 or 26 MHz, and those have much better phase noise and tempco than typical crystal oscillators in cans that you would get out of most other consumer products. The control voltage provides an easy way to adjust it

(over a few PPM range only, e.g. calibrate it to a received frequency standard, which is what the phone does). Now in new phones they are starting to use on-chip oscillators with a separate crystal that would be less useful to homebrewers as it is not inherently temperature-compensated without the phone's software. It would still be a good crystal though, and in many cases the specifications can be found for the crystal.

The PA is normally still a separate component, so if you want a watt or so of RF then that component could quite likely be reused though they are fairly narrow-band if you want the full performance.

Other things you might find are LNA chips and SAW filters (e.g. in 3G phones you would find one at the Tx frequency and another at the RX frequency, in Europe this is a 60 MHz bandwidth centred at 1950MHz or 2140MHz. This might be useful as a first IF in some kind of up-converting architecture like a spectrum analyser.

I have also seen some websites where they have figured out how to drive the colour LCD panels out of recent phones for microcontroller projects.

Chris

Hi there: Heriberto.
Japanese unknown to me also!
I have tried searching Google with different combinations of words but
no result.
You probably searched also.
Maybe someone in/araound Japan can help?????
Try a 'boat-anchors' radio group????
Warm regards from Canada where it has been snowing!
Terry.

developlement - linear rf power amplifier, 2 * T380-1 grid base valves, 3 - 30 MHz, 1 KW

Linear Roehren-Endstufe für den Kurzwellen Amateurfunkbetrieb von 3.0 - 30 Mhz und einer Dauerstrichleistung bis 1 KW mit zwei Sendetrioden T-380-1 in Gitterbasisschaltung

ein Selbstbaukonzept für lizenzierte Funkamateure entwickelt von Werner Grosse - DK3QV - vielfach nach gebaut von 1983 - 1989

download - http://www.dk3qv.de

1. Einleitung

Diese Beschreibung der Selbstbau KW-Linearendstufe soll diejenige Gruppe der Funkamateure ansprechen, die immer noch mit großem Interesse verschiedene Geräte und Teile Ihrer Funkanlage mit zum Teil bescheidenen Mitteln selbst bauen.Das dazu eine Menge theoretischer und praktischer Erfahrungen, auf dem Gebiet der Elektronik und HF-Technik erforderlich sind, ist fast selbstverständlich. Aber auch Funkamateure, die sich bisher noch nicht so intensiv mit dem Selbstbau verschiedener Geräte befaßt haben kann diese Baubeschreibung viele praktische Tips und Hinweise liefern. Da die beschriebene KW-Linearendetufe nur von lizenzierten Funkamateuren mit der Lizenzklasse B betrieben werden darf, soll hier vollständigkeitshalber nochmal erwähnt werden.

2. Ausgangsbasis für den Selbstbau einer Kurzwelle

Die Ausgangsbasis für den Selbstbau dieser KW-Linearendstufe war einerseits das große Interesse am Selbstbau und andererseits die Möglichkeit eines Nachbaues dieser Endstufe zu schaffen.Da die Kaufpreise von neuwertigen KW-Linearendstufen verschiedener Hersteller meist über 2500 DM (verschiedene auch weitaus höher) liegen und die Einzelpreise der Austausch- oder Ersatzröhren bis zu DM 500,-/Stck. betragen, kommt auch noch ein finanzieller Aspekt hinzu. Für diese

Endstufe sind fast sämtliche verwendete Bauteile (sofern nicht in sogenannten Funkbastelkisten vorhanden) mit Ausnahme der beiden Sendetrioden T 380-1, sehr kostengünstig auf den von Funkamateuren organisierten Flohmärkten erworben werden. Der gesamte Aurbeitsaufwand ist, je nach persönlicher Begabung des einzelnen und nach Ausstattung der Endstufe, mit etwa 150 - 250 Std. anzusetzen.

Bei der Wahl der Senderöhren und der Ausgangsleistung der Endstufe wurde der neuen DV-AFuG vom 11.12.1981, wonach in Lizenzklasse B die Spitzenausgangsleistung 750 Watt (und wobei die Summe der Anodenverlustleistungen 750 W betragen kann) nicht überschritten werden darf, Rechnung getragen. Die hier konzipierte Endstufe arbeitet mit 2 parallel betriebenen Sendetrioden des Typs T 380-1 von ABB in der Gitterbasisschaltung und erreicht eine Ausgangsleistung von 750 Watt in allen Betriebsarten und auf allen Bändern bei einer Ansteuerung von 80 - 100 Watt. Da die Gesamtanodenverlustleistung der beiden Röhren 760 Watt beträgt, lassen sich diese im AB-1 Betrieb schonend fahren, was den Intermodulationsabstand erhöht und sich positiv auf die Lebensdauer der Röhren auswirkt. Ein weiterer Vorteil ist die Nutzung der Ausgangsleistung von 750 Watt in allen Betriebsarten und auf allen Bändern, was auf die enormen Leistungsreserven der Röhren zurückzuführen ist.

Die beschriebene Endstufe muß vom mechanischen und elektrischen Aufbau sowie deren Ausstattung nicht unbedingt bindend oder als optimal angesehen werden. Hier sind sicherlich eine Reihe von Änderungsmöglichkeiten denkbar. Dies aber bleibt letztlich jedem Funkamateur, seiner Phantasie und seiner Kreativität überlassen. Diese Beschreibung kann nur die nötigen Denkanstöße dazu liefern.

3. Mechanischer Aufbau

Durch den großen Platzbedarf und das enorme Gewicht der vorhandenen Transformatoren wurde das Netzgerät in einem getrennten Stahlblechgehäuse untergebracht. Das Gehäuse der Endstufe war aus verschiedenen 2 mm starken Aluminiumplatten zusammengeschraubt worden und hatte etwa die Abmessungen 380*320*280 mm.

Es leider nicht möglich, die seinerzeitigen Ansichtsfotos hier abzubilden.

Alle Netzteilbauteile wurden auf einer kräftigen 3 mm starken Stahlblechmontagetafel aufgebaut, welche dann mit dem Gehäuseboden verschraubt sind. Die notwendigen Bedienungselemente sind in die Frontplatte eingebracht und diverse Anschlußkabel mit Knickschutztüllen nach hinten herausgeführt. Für die.elektrischen Verdrahtungen wurden im Netzteil entsprechende Lötleisten aufgebaut. Das gesamte Gehäuse ist mit einem U-förmigen Deckel verschließbar.

Das Alugehäuse der Endstufe war durch ein Zwischenblech so aufgeteilt worden, daß im unteren 100 mm hohen Teil der gesamte HF-Eingangsteil sowie die Steuerung, und im 180 mm hohen oberen Teil der gesamte HF-

Leistungsteil untergebracht war.

Im oberen Teil sind folgende Bauteile plaziert : Plate- und Loaddrehkondensatoren, Bandwahlschalter, Auskoppelkondensatoren, Keramikrippenkörper, Luf'tspule L 10, Anodendrossel und die beiden Senderöhren. Für ausreichende Luftkühlung sorgt hier ein Ventilator mit 160 m3/h und eine entsprechende strömungsgünstige Luftführung.

Im unteren Teil der Endstufe sind die Bauteile : Steuerungselemente, Verdrahtung, Lötleisten, Steckerzuführung, Hochspannungsanschluß, Röhrenfassungsanschlüsse, HF-Eingangsteil mit Bahnwahlschalter, Antennenanschlüsse, Antennenrelais sowie die Katodendrossel zu finden.

Zur Bedienung und Überwachnung sind in die Frontplatte eingebaut : Plate, Load, Bandwahl-Ausgangsschalter, Betriebsartenschalter, Meßgeräteumschalter, Meßgerät-relativer HF-Output, Meßgerät-Ia1/Ua usw., Bandwahl- Eingangsschalter, Lüfterschalter, Lüfter schnell/ langsam sowie zwei Leuchtdioden.

Auf der Geräterückwand befinden sich der Hochspannungsanschluß, Soriau-Mehrpolstecker, Erdungsschrauben sowie der Amphenolsteckeranschluß zur externen Steuerung. Das gesamte Gehäuse konnte mit einem feinperforierten Deckel allseitig geschlossen werden.

Wesentliche Informationen sind noch zu den elektrischen Verdrahtungen und Aufbauten noch anzufügen : Sämtliche Spannungsanschlüße sind mit Keramikscheiben und MKS-Kondensatoren gegen HF abgeblockt worden. Der Hochspannungsanschluß wurde aus Polyamid hergestellt und hatte eine eingebaute 4 mm Buchse zur Aufnahme des Hochspannungsanschlußsteckers. Als Hochspannungskabel wurde eine spannungsfeste Ausführung mit 1mm2 Querschnitt gewählt. Zur Kontaktierung des Verbindungskabels zur Endstufe wurde ein mehrpoliger Soriaustecker bzw. Kupplung gewählt, wobei der Stecker in die Gehäuserückwand der Endstufe eingebaut ist. Netzteil und Endstufe wurden außerdem zum besseren Potentialausgleich zusätzlich mit 6 mm2 Erdungs- leitungen verbunden.

Sämtlich Hochspannungskabel und Anschlüsse sind sowohl im Netzteil wie auch in der Endstufe zusätzlich mit Silikonschläuchen versehen, was ganz erheblich zur besseren Isolierung beitrug. Damit der Spannungsverlust auf den Heizleitungen mit 5V/30 A so gering als möglich blieb, mußten entsprechend starke Kabelquerschnitte verwendet werden (hier 6 mm2). Um die Ausgangs- schwingkreisverluste der Endstufe so gering als möglich zu halten, wurden hier ausschließlich 14 mm breite und 1 mm starke versilberte Kupferbänder eingesetzt. Die Röhrenanschlußsterne sind mit flexiblen, starkgeflochtenen Kupferbändern zum Auskoppelkondensator C35 (1000 pF/12 KV) verbunden.

Weitere Einzelheiten der Verdrahtung sind direkt dem Schaltplan in den Bildern 1 und 2 sowie den beigefügten Tabellen 3 - 9 zu entnehmen.

4. Theoretische Grundlagen

Die Grundlagen dieser Gerätebeschreibung bilden in ersten Linie die praktischen Kenntnisse und Erfahrungen zum Selbstbau einer solchen Linearendstufe. Da es aber nicht ganz ohne die notwendigen theoretischen Kenntnisse geht, die zum Bau einer solchen Endstufe erforderlich sind, wird jeder wissen, der sich schon mit dem Selbstbau befaßt. Hier sollen nur die wichtigsten theoretischen Grundlagen kurz erläutert und dargestellt werden, die auch zum Teil bei dem Bau dieser Endstufe mitgewirkt haben. Die grundsätzliche Arbeitsweise einer solchen KW- Linearendstufe wird hierbei vorausgesetzt. Wer darüber hinaus seine Kenntnisse weiter vertiefen möchte, dem sei auf die unten angegeben Literaturquellen hingewiesen.

Wie aus der Grundschaltung in Bild 3 zu sehen ist, wird die Hochfrequenzleistung über ein breitbandiges Eingangs-Filter symmetrisch in die Katode eingekoppelt.

Die Auskoppelung erfolgt hier durch das vielbewährte selektive Ausgangs-PI-Filter. Das Gitter der beiden Röhren liegt bei der Gitterbasisschaltung, die auch grounded-grid genannt wird, sowohl gleich, wie auch wechsel- spannungsmäßig direkt an Masse und bildet so eine natürlich Abschirmung zwischen Katode und Anode, ohne das die Röhre ihre Verstärkereigenschaft verliert.

Der Arbeitspunkt wird hierbei über eine automatische Gittervorspannung erzeugt (indem die Katode positiver gegenüber dem Gitter gesetzt ist), die durch den Arbeitswiderstand im Katodenkreis, hier die Zenerdiode D 1, festgelegt ist. Der Arbeitspunkt ist so gewählt, daß sich im AB-1-Betrieb eine Katodenspannung von Uk = 55 - 60V bei einer Anodenspannung von Ua = 2600 V/DC einstellt. Hierdurch ist sichergestellt, daß sich der Arbeitspunkt immer noch im teillinearen Bereich der Triodenkennlinie befindet. Der Ruhestrom betrug hierbei 80 mA/Röhre. Die beiden Drosseln Dr. 2/3 dienen zur Unterdrückung von Huth-Kühn-Schwingungen, die durch schädliche Gitter- Anodenkapazitäten Cg-a1 und Cg-a2 = 14 pf hervorgerufen werden. Damit die eingekoppelte HF-Leistung nicht über die Heizleitung zum Netztrafo (direkt geheizte Katode) abfließt, sind zwei Heizdrosseln Dr. 4/5 erforderlich. Sie müssen den Heizstrom (Ih = 30 A) und den Katodenstrom (Ikmax. = 1,0 A) ohne große Verluste führen können. Die hier erstellte Ausführung hatte einen Querschnitt von annähernd 3,2 mm2 bei einer Induktivität von Lh = 2,2 mH.

Vorteile der Gitterbasisschaltung mit 2 parallel betriebenen Trioden
* Eingangs- und Ausgangsspannung sind in Phase, es sind keine Neutralisation oder besondere Abschirmungen erforderlich
* die Treiberleistung wird nicht in Wärme umgesetzt, sondern durch die Endstufe durchgereicht
* Wahl des Arbeitspunktes im teillinearen Bereich der Triodenkennlinie (geringere nichtlineare Verzerrungen und deren Mischprodukte) im AB-1 Betrieb
* durch die Parallelschaltung läßt sich die Ausgangsleistung fast verdoppeln
* einfacher Aufbau des Eingangs- und Ausgangskreises

* geringere Treiberleistung als bei Tetroden oder Pentoden erforderlich
* einfacher Aufbau des Netzteiles, da nur wenige Spannungen erforderlich sind
* finanzieller Vorteil durch die Verwendung von zwei ,,kleineren" Röhren gegenüber einer wesentlich teureren großen Röhre

Als Nachteile sind zu nennen :
* Summierung der Röhrenkapazitäten (Cga1 + Cga2), was zur Herabsetzung der Grenzfrequenz und somit zur Leistungsminderung auf den oberen Bändern führt
* Begünstigung von Huth-Kühn-Schwingungen durch Cgal + Cga2
* durch den sehr niederimpedanten Eingangswiderstand (Re = 62.5 Ohm) ist eine relativ hohe Treiberleistung erforderlich
* da zwei Triodenkennlinien keinen absolut gleichen Verlauf aufweisen, steigen die nichtlinearan Verzerrungen (Intermodulationsstörungen und deren Mischprodukte) gegenüber der Verwendung von nur einer Röhre wieder etwas an

5. Berechnung der Eingangs- und Ausgangsbedingungen

Der Eingangswiderstand der Röhre berechnet sich gemäß Bild 4.

Damit liegen die errechneten Eingangs- und Innnenwiderstände vor: RE ~ 62,5 Ohm, Ri ~ 1,75 KOhm

Aufgabe der Eingangs- und Ausgangs-PI-Filter ist es, den Eingangswiderstand von Zein- = 50 Ohm auf Rein~ 62,5 Ohm herauf- und den Innenwiderstand von Ri = 1,75 KOhm auf Zaus = 50 Ohm herab- zu transformieren. Da die komplexe Berechnung von Filtern den Rahmen dieser Beschreibung sprengen würde, kann hier nur auf den entsprechenden Literaturquellen verwiesen werden.

Die in Bild 5 aufgeführte Tabelle mit sämtlichen Berechnungen und Werten für die Ausgangs- PI-Filter wurde nach Unterlagen von DJ6HP (Kurzwellen- und Amateurfunktechnik) und DL3CI (CQ-DL 9/80) zusammengestellt.

Die Güte Q wurde hier mit ~11 angesetzt, was in der Praxis einen guten Kompromiß zwischen hoher Güte (große Resonanzströme und damit verbundenen Verlusten) und selektiver Oberwellenunterdrückung darstellt. Zum Vergleich sind auch noch die einem mit Induktivitätsmeßgerät als Frequenzzählervorsatz gemessenen und unabhängig von den PI-Filterberechnungen ermittelten Spulendaten eingetragen.

Die Berechnungsformel für einlagige Luftspulen ist in Bild 5 mit angegeben.

Die Tabelle in Bild 5 zeigt deutlich, daß sich auf den oberen Bändern der induktive Aufbau des Ausgangs-PI-Filters schon bemerkbar macht (errechnete Induktivität und Sollinduktivität zur gemessenen Induktivität).

Ansonsten sind die errechneten Daten in der Größenordnung zu finden, die sich auch später praktisch einstellten.

Das Eingangsfilter wurde breitbandig ausgelegt und hat eine Güte Q von ~ 2.0. Auf ein weiteres Berechnungsbeispiel wurde an dieser Stelle verzichtet. So sind deren Daten direkt der Tabelle 1 aus Bild 6 entnehmbar.

Mit dem Eingangsbandwahlschalter ist auch eine direkte HF-Einspeisung ohne das Eingangsfilter in Schalterposition 7 möglich. Es zeigte sich aber deutlich, daß diese kleine Fehlanpassung von Zein = 50 Ohm und Rein ~ 62,5 Ohm zu einer Leistungsverminderung von 10 - 20 % am Ausgang der Endstufe führen kann. Außerdem wird der Intermodulationsabstand des Ausgangssignales bei dieser Arbeitsweise um etwa 5 dB geringer anzusetzen sein. Das Stehwellenverhältnis SWR für den Endstufeneingang mit diesem Eingangsfilter lag auf allen Bändern unter 1 : 2,0.

6. Leistungsverstärkung der Endstufe

Wie aus Tabelle 4 in Bild 8 zu sehen ist, beträgt die Leistungsverstärkung :
V = 10 Log. * Pout/Pin (in dB) auf allen Bändern zwischen 9,21 und 9,81 dB.

Diese Leistungsverstärkung reicht aus, um bei einer Ansteuerleistung von 80 - 100 Watt (auf allen Bändern) auch noch sichere 750 Watt - Ausgangsleistung zu erhalten. Der Abfall der Leistungs- verstärkung zu den höheren Bändern, ist bei dem Ansteuertransciver wesentlich stärker ausgeprägt (hier der Kennwood TS-515 mit bis zu 1,2 dB), als bei der Endstufe, wo der Leistungsabfall ca. 0,6 dB beträgt. Dies ist auf den soliden Aufbau des HF-Eingangs- und Ausgangskreises sowie der Verwendung der beiden steilen Trioden zurückzuführen. Der Endstufenwirkungsgrad liegt auch hier, wie erfahrungsmäß bekannt, im AB-1 Betrieb zwischen 50 - 60%.

7. Schaltungsbeschreibung

Wie aus dem Schaltplan des Netzteiles der Linearendstufe in Bild 2 zu sehen ist, sind dort die notwendigen Transformatoren, Gleichrichter und Steuerungelemente untergebracht. Die beiden Hochspannungstransformatoren m4 und m4 werden durch Betätigung des Steuerrelais d1 (Anodenspannung-EIN) über zwei parallelgeschaltete Widerstände (R4/R5 von 150 Ohm/7W) eingeschaltet. Deren Überbrückung erfolgt zwei Sekunden zeitverzögert durch d2. Diese bekannte Einschaltungsart von großen Transformatoren vermindert den Rush-Effekt für konventionelle 16A/H- oder L-Automaten der Netzabsicherung.

Das Hochspannungsnetzteil ist sehr spannungssteif ausgeführt und beinhaltet nur leistungskräftige Bauteile. Als Hochspannungsgleichrichter ist ein Drehstrombrückengleichrichter mit 4500V/DC Sperrspannung und 1,8 A Nennstrom verwendet. Die Hochspannungsglättungskondensatoren bestehen aus zwei Bosch MP-

Kondensatoren von jeweils 15uF/3KV. Die erforderlichen Versorgungsspannungen von +165V/0.2A, 12V/2A sind in bekannter Form erzeugt. Alle Spannungen mit Ausnahme der Hochspannung, werden über eine mehrpolige Soriau-Buchse und Stecker zur Endstufe geführt. Bei hoher Strombelastung (Heizspannung) sind mehrere Steckerstifte parallel geschaltet. Verschiedene Funktionen sind optisch mit Leuchtdioden angezeigt. Verdrahtungsquerschnitte sind im Schaltplan, sofern erforderlich, angegeben.

Im Schaltplan von Bild 1 ist die Endstufe dargestellt.

Da zuvor die theoretischen Grundlagen der Gitterbasisschaltung für zwei parallelbetriebene Sendetrioden beschrieben worden ist, sind hierzu nur noch wenige Punkte anzufügen. Mit dem keramischen Eingangsbandwahlschalter b2 wird das komplette Eingangs-PI-Filter für alle Bänder umgeschaltet. Der keramische Ausgangs- bandwahlschalter b3 ist mit kräftigen Kontakten (hier für 50 A) ausgeführt, um die hohen Resonanzströme ohne groß Verluste führen zu können. Der Plate-Drehkondensator C 36 hat 250 pF bei 6 KV Spannungsfestigkeit und der Load-Drehkondensator C37 1000 pF bei 3KV Spannungsfestigkeit. Eine deutlich höhere Spannungsfestigkeit hat der Auskoppelkondensator C 35 bei 1000 pF/12 KV.

Aus Platzgründen wurde auf eine Abschluß scheibendrossel L~2,5 mH, die parallel zu C 38 - C 41 liegen müßte, verzichtet. Diese Abschluß scheibendrossel und galvanische Kopplung gegen Masse kann verhindern, daß bei durchgeschlagenem Auskoppelkondensator C 35 die Hochspannung an der Antenne anliegt. Da der Auskoppelkondensator eine Spannungsfestigkeit von 12 KV aufweist und sich eine maximale Anodenspitzenspannung von 8 KVss einstellt , ist diese Möglichkeit allerdings sehr gering. Achtung : Trotzdem immer einbauen !

Sämtliche Gitteranschlüsse sind mit keramischen Scheibenkondensatoren (C30 - C33 = 4700 pF) und Widerständen (R19 - R22 = 3,3 Ohm) abgeschlossen worden. Diese Widerstände erlauben außerdem eine Gitterspannung bzw. Gitterstrommessung über den Meßbereichsumschalter b7 und das Anzeigemeßinstrument g2. Der Eingang der Katodendrossel Dr. 1/2 s. Tabelle 3 in Bild 7) ist ebenfalls mit keramischen Scheibenkondensatoren C26/27 = 4700 pF abgeschlossen. Die Katodenspannung von 55 - 60 V (vom Mittelanschluß des Heiztrafos über den Steckerpin) stellt sich über eine Reihen- und Parallelschaltung von Dioden (n 24 - n 187) und deren Durch- laßspannung ein. Diese Dioden müssen den Katodenstrom (hier max. 1,5 A) sicher führen können und die auch entstehende Verlustwärme Pv - UK * IK = 48 Watt (bei ~ Ik = 0,8 A) aufnehmen können. Alternativ hierzu sind auch Zenerdioden, die auf einem Kühlblech isoliert aufgebaut sind, einsetzbar. Da Zenerdioden auf Grund unterschiedlicher Kennlinien und Zenerspannungen nicht parallel schaltbar sind, kommen somit nur leistungsstarke Fabrikate in Frage.

Nachteilig, und das gilt für beide Katodenspannungserzeugungsarten, ist die Tatsache, daß durch die Eigenerwärmung die

Diodenschwellspannung und somit auch die Zenerspannung sich etwas nach unten verändert. Die in der Praxis ermittelte Änderung der Katodenspannung lag in der Größenordnung von etwa 10 %. Diese Auswirkungen (die Katodenspannung sinkt um etwa 10 % ab), nach der sich der Arbeitspunkt im AB-1 Betrieb etwas näher zum A-Betrieb hin verändert und den Katodenstrom etwas ansteigen läßt, hatte bei späteren praktischen Messungen allerdings keine größeren Auswirkungen.

Das Antennenrelais, eine kräftige 12V-Ausführung mit 15A Kontakten, ist in unmittelbarer Nähe der PL-Buchsen auf Gummiringen zur Schaltgeräuschverminderung montiert. Die Verbindung vom HF-Ausgangskreis zum Antennenrelais erfolgte mit einem 20 cm kurzen Koaxialkabel RG 58-U. Da sich dieses Koaxialkabel vorzüglich verarbeiten und biegen läßt, wurden bewußt kleinere Kabelverluste in Kauf genommen.

Ein kräftiger 230V/AC-Ventilator, der für eine ausreichende Kühlung sorgt, ist von der Frontplatte aus auf schnell bzw. langsam umschaltbar. Die gesamte Betriebsartensteuerung ist mit den 12-V Relais d3 - d6 aufgebaut und kann über den Betriebsartenschalter entsprechend vorgewählt werden. Zur externen PTT-Steuerung ist das Relais d6 benutzt. Eine HF-Vox-Steuerung ist nicht eingesetzt. Dies gilt ebenso für eine ALC-Spannungsgewinnung vom HF-Ausgangssignal zur Leistungssteuerung des Ansteuertranscievers. Nachteilig war dies beim späteren Betrieb nicht.

Mit dem Meßbereichsumschalter und Anzeigeinstrument g2 können folgende Spannungen und Ströme während des Betriebs gemessen werden:
1 - Ua, 2 - Ik, 3 - Igl, 4 - IgR1, 5 - IgR2, 6 - Uver+165V, 7 - Uver +12V

Mit dem Anzeigeinstrument gl ist der relative HF-Output (nicht frequenzkompensiert) moderat angezeigt. Im Stand-by-Betrieb wird die Katodenspannung auf + 165 V gelegt, was zur absoluten Sperrung der beiden Trioden bei Ua=2800V ausreicht. Wichtige Schaltungszustände sind optisch mit den Leuchtdioden LED 3 und 4 signalisiert.

Sämtliche Versorgungs- und Steuerspannungen werden gegen die Hochfrequenz mit entsprechenden Kondensatoren abgeblockt. Die Anodendrossel Dr. 3 (s. Tabelle 3 in Bild 7) ist einlagig auf einem Keramikkörper aufgebracht worden und dient zur Zuführung der Hochspannung in den Anoden- kreis. Der keramische Hochspannungskondensator c34 = 5000 pF/5KV blockt hierbei die HF vom ,,kalten Ende" der Drossel ab.

8. Verwendete Meßgeräte und Meßverfahren

Folgende Meßgeräte und Hilfsmittel standen zum Selbstbau der Linearendstufe zur Verfügung :
* 100 MHz - Zweistrahlloszilloskop, Typ: HM 512 N
* Heathkit - Wattmeter HM 102/1 KW
* Dummyload HN 31/1 KW

* L- und C-Meßgeräte als Frequenzzählervorsätze
* SVR-Meßgeräte 1 KW
* Tongenerator 1 - 100 KHz
* sowie verschiedene konventionelle analoge und digitale Volt- und Ampereme ter.

Leider stand zur Messung des Intermoduationsabstandes und Spektrums kein Zweitonsignalgenerator und Spektrumanalysator zur Verfügung. Der Abstand der Intermodulationsprodukte 3. Ordnung des Ausgangssignales liegt erfahrungsgemäß bei ca. 40 dB vom Sollsignal und sollte bei Linearendstufen noch etwa um den Faktor der Leistungsverstärkung, hier 9,5 dB, höher anzusetzen sein, damit die effektiven Intermodulationsstörungen und deren Mischprodukte bei gegebenem Abstand zum Sollsignal bei größerer Ausgangsleistung auch im gleichen Verhältnis klein bleiben. Beim späteren Betrieb der Linearendstufe, und dies wurde in vielen QSO's vom jeweiligen Gesprächspartner bestätigt, sind keine unerwünschten Verzerrungen oder Splatter sowie Nebenausstrahlungen aufgetreten.

Dennoch sind vor dem Betrieb der Endstufe einige Ausgangssignale oszillographiert, die mit den vorhandenen technischen Mitteln möglich waren. Hierbei war kein sogenanntes flat-topping zu beobachten und die HP-Amplitude zeigte sich als reine Sinusform. Auch konnten keine unerwünschten Phasendifferenzen zwischen Eingangs und Ausgangskreis, die durch falsche Übersetzungsverhältnisse des Ausgangskreises und deren Blindkomponenten entstehen können, festgestellt werden. Solche Phasendifferenzen können ebenfalls zu Fehlanpassungen und Fehlabstimmungen mit den bekannten Auswirkungen führen.

9. Praktische Betriebserfahrungen
Die genannte KW-Linearendstufe ist in dieser Applikation mit dem KW-Kennwood-Transciver TS-515 angesteuert. Als Antenne ist ein Doppeldipol für 80 und 40 m sowie ein Dreielement-Beam von Hygain TH3-MHK in 28 m Höhe verwandt. Die praktischen Betriebserfahrungen mit dieser Selbstbau-Endstufe sind als sehr gut zu bezeichnen. Auch die Abstimung des Transcivers auf den Endstufeneingangskreis und die Abstimmung des Endstufenausgangskreises an die Antenne ist auf allen Bändern ohne Probleme durchzuführen. Die Stehwellenverhältnisse betragen auf 10, 15 und 20 m mit dem Beam etwa 1 : 2.0 und bei den Doppeldipolen (die nur 2 m über dem Hausdach aufgebaut sind) etwa 1 : 2,0 bis 1 : 3,2.

Sehr von Vorteil ist auch die Zweistufenumschaltung des kräftigen Ventilators, der in der zweiten Stufe schon hörbare Windgeräusche verursacht, die bei leisen Empfangsdurchgängen stören können. RTTY- oder CW Betrieb wurde bisher mit dieser Endstufe noch nicht ausgeübt. Es zeigten sich aber auch bei langen Phonie-Durchgängen keine Überlastungen der Röhren. Die Anoden der Röhren erhielten lediglich eine rötliche Färbung, was als ,,normaler". Betriebszustand anzusehen ist. Durch die strömungsgünstige Luftführung wurde die Verlustwärme auch sehr schnell aus dem Gehäuse herausgetragen. Ein großer Vorteil

ist ebenfalls die Möglichkeit, ständig alle Spannungen und Ströme mit dem eingebauten Meßinstrument zu überwachen, ohne hierzu das eingebaute Outputmeter umzuschalten.

Die sichere Funktion, Arbeitsweise und Leistungsfähigkeit eines jeden Selbstbaugerätes ist hierbei auch der beste Erfolg für den Funkamateur.

Source record: 8558

When you are tracking a moving object, aprspoint will record all its positions on the map, and optionally connect them with lines to form a track. If you are tracking multiple moving objects at the same time, the map could get cluttered quickly. In this new version, you can choose to selectively remove an individual object's track, or remove all tracks on the map. This version also includes fixes for several bugs reported by the users. We have also tested it extensively on the Vista platform as well. Old keys will no longer work on this new version, please refer to the web site http://www.aprspoint.com for upgrade details.

I came across a couple of old original battery packs (full of defunct carbon-zincs) that took the innards out of so that i can fill it with D cells for the "A" voltage and 9v batteries for the "B" power. You can get the 9v battery connectors at Mouser for to cents apiece by the hundred, and 5 cents for the pair if you buy just the connector snaps and solder your own wires. But I thought that it would be good to have a battery pack that would take just one type of battery at a minimum number. 6 "D" cells sounds interesting, and should give a reasonable life. I suppose I could use 10 9v battereis for the "B" supply and two or three 9v in parallel for the "A" but that is still a dozen or more batteries and the "A" supply won't last long. Also a person could use 60 + 6 "AA" cells . . . .
I know at least one person sells a dc/dc converter for Transoceanics that takes 9 DC cells (+ 1 for the dial light) but they want 90 bucks for it plus what ever the shipping charge is.

Go to the ARRL.

Unless something has changed in recent years, they'd sell you the back
issue you want, and if they don't have copies, sell you a photocopy of
the specific article.

Hi,

I have built two mixers for a direct conversion receiver. One of them a single transistor mixer, the other one is a single balanced diode mixer. I already have AF amplifier and LO stages. I think both are working fine seperately, but i can't hear anything when i connect the LO and the amplifier to the mixers(either of them of course). Is there any way that i can test these two mixers without test equipment like an oscilloscope or a signal generator? I also don't have a RF probe right now, only a multimeter. Actually i have another questions with this receiver, too, but this is where i am stuck at the moment.

(LO is a crystal controlled one. I built a VFO, too, but didn't manage to get it working, for now.)

Thanks in advance...

==========
A good reason to build such a converter yourself....probably for
peanuts. A 555 IC ,2 power transistors and a few passive components
Google is your friend. After all this is THE homebrew NG.

Good Luck

.
Come to think of it the number does look like a small CRT!
But Heriberto is sure it is transmitting tube, possibly from a marine
service transmitter.
Could the 3P41 be a batch number not a tube type????

developlement - linear rf power amplifier, 2 * T380-1 grid base valves, 3 - 30 MHz, 1 KW

Linear Roehren-Endstufe f&#65533;r den Kurzwellen Amateurfunkbetrieb von 3.0 - 30 Mhz und einer Dauerstrichleistung bis 1 KW mit zwei Sendetrioden T-380-1 in Gitterbasisschaltung

ein Selbstbaukonzept f&#65533;r lizenzierte Funkamateure entwickelt von Werner Grosse - DK3QV - vielfach nach gebaut von 1983 - 1989

download - http://www.dk3qv.de

1. Einleitung

Diese Beschreibung der Selbstbau KW-Linearendstufe soll diejenige Gruppe der Funkamateure ansprechen, die immer noch mit gro&#65533;em Interesse verschiedene Ger&#65533;te und Teile Ihrer Funkanlage mit zum Teil bescheidenen Mitteln selbst bauen.Das dazu eine Menge theoretischer und praktischer Erfahrungen, auf dem Gebiet der Elektronik und HF-Technik erforderlich sind, ist fast selbstverst&#65533;ndlich. Aber auch Funkamateure, die sich bisher noch nicht so intensiv mit dem Selbstbau verschiedener Ger&#65533;te befa&#65533;t haben kann diese Baubeschreibung viele praktische Tips und Hinweise liefern. Da die beschriebene KW-Linearendetufe nur von lizenzierten Funkamateuren mit der Lizenzklasse B betrieben werden darf, soll hier vollst&#65533;ndigkeitshalber nochmal erw&#65533;hnt werden.

2. Ausgangsbasis f&#65533;r den Selbstbau einer Kurzwelle

Die Ausgangsbasis f&#65533;r den Selbstbau dieser KW-Linearendstufe war einerseits das gro&#65533;e Interesse am Selbstbau und andererseits die M&#65533;glichkeit eines Nachbaues dieser Endstufe zu schaffen.Da die

Kaufpreise von neuwertigen KW-Linearendstufen verschiedener Hersteller meist ber 2500 DM (verschiedene auch weitaus h her) liegen und die Einzelpreise der Austausch- oder Ersatzr hren bis zu DM 500,-/Stck. betragen, kommt auch noch ein finanzieller Aspekt hinzu. F r diese Endstufe sind fast s mtliche verwendete Bauteile (sofern nicht in sogenannten Funkbastelkisten vorhanden) mit Ausnahme der beiden Sendetrioden T 380-1, sehr kosteng nstig auf den von Funkamateuren organisierten Flohm rkten erworben werden. Der gesamte Aurbeitsaufwand ist, je nach pers nlicher Begabung des einzelnen und nach Ausstattung der Endstufe, mit etwa 150 - 250 Std. anzusetzen.

Bei der Wahl der Sender hren und der Ausgangsleistung der Endstufe wurde der neuen DV-AFuG vom 11.12.1981, wonach in Lizenzklasse B die Spitzenausgangsleistung 750 Watt (und wobei die Summe der Anodenverlustleistungen 750 W betragen kann) nicht berschritten werden darf, Rechnung getragen. Die hier konzipierte Endstufe arbeitet mit 2 parallel betriebenen Sendetrioden des Typs T 380-1 von ABB in der Gitterbasisschaltung und erreicht eine Ausgangsleistung von 750 Watt in allen Betriebsarten und auf allen B ndern bei einer Ansteuerung von 80 - 100 Watt. Da die Gesamtanodenverlustleistung der beiden R hren 760 Watt betr gt, lassen sich diese im AB-1 Betrieb schonend fahren, was den Intermodulationsabstand erh ht und sich positiv auf die Lebensdauer der R hren auswirkt. Ein weiterer Vorteil ist die Nutzung der Ausgangsleistung von 750 Watt in allen Betriebsarten und auf allen B ndern, was auf die enormen Leistungsreserven der R hren zur ckzuf hren ist.

Die beschriebene Endstufe mu vom mechanischen und elektrischen Aufbau sowie deren Ausstattung nicht unbedingt bindend oder als optimal angesehen werden. Hier sind sicherlich eine Reihe von nderungsm glichkeiten denkbar. Dies aber bleibt letztlich jedem Funkamateur, seiner Phantasie und seiner Kreativit t berlassen. Diese Beschreibung kann nur die n tigen Denkanst e dazu liefern.

3. Mechanischer Aufbau

Durch den gro en Platzbedarf und das enorme Gewicht der vorhandenen Transformatoren wurde das Netzger t in einem getrennten Stahlblechgeh use untergebracht. Das Geh use der Endstufe war aus verschiedenen 2 mm starken Aluminiumplatten zusammengeschraubt worden und hatte etwa die Abmessungen 380*320*280 mm.

Es leider nicht m glich, die seinerzeitigen Ansichtsfotos hier abzubilden.

Alle Netzteilbauteile wurden auf einer kr ftigen 3 mm starken Stahlblechmontagetafel aufgebaut, welche dann mit dem Geh useboden verschraubt sind. Die notwendigen Bedienungselemente sind in die Frontplatte eingebracht und diverse Anschlu kabel mit Knickschutzt llen nach hinten herausgef hrt. F r die.elektrischen Verdrahtungen wurden im Netzteil entsprechende L tleisten aufgebaut.

Das gesamte Geh�use ist mit einem U-f�rmigen Deckel verschlie�bar.

Das Alugeh�use der Endstufe war durch ein Zwischenblech so aufgeteilt worden, da� im unteren 100 mm hohen Teil der gesamte HF-Eingangsteil sowie die Steuerung, und im 180 mm hohen oberen Teil der gesamte HF-Leistungsteil untergebracht war.

Im oberen Teil sind folgende Bauteile plaziert : Plate- und Loaddrehkondensatoren, Bandwahlschalter, Auskoppelkondensatoren, Keramikrippenk�rper, Luf'tspule L 10, Anodendrossel und die beiden Sender�hren. F�r ausreichende Luftk�hlung sorgt hier ein Ventilator mit 160 m3/h und eine entsprechende str�mungsg�nstige Luftf�hrung.

Im unteren Teil der Endstufe sind die Bauteile : Steuerungselemente, Verdrahtung, L�tleisten, Steckerzuf�hrung, Hochspannungsanschlu�, R�hrenfassungsanschl�sse, HF-Eingangsteil mit Bahnwahlschalter, Antennenanschl�sse, Antennenrelais sowie die Katodendrossel zu finden.

Zur Bedienung und �berwachnung sind in die Frontplatte eingebaut : Plate, Load, Bandwahl-Ausgangsschalter, Betriebsartenschalter, Me�ger�teumschalter, Me�ger�t-relativer HF-Output, Me�ger�t-Ia1/Ua usw., Bandwahl- Eingangsschalter, L�fterschalter, L�fter schnell/ langsam sowie zwei Leuchtdioden.

Auf der Ger�ter�ckwand befinden sich der Hochspannungsanschlu�, Soriau-Mehrpolstecker, Erdungsschrauben sowie der Amphenolsteckeranschlu� zur externen Steuerung. Das gesamte Geh�use konnte mit einem feinperforierten Deckel allseitig geschlossen werden.

Wesentliche Informationen sind noch zu den elektrischen Verdrahtungen und Aufbauten noch anzuf�gen : S�mtliche Spannungsanschl��e sind mit Keramikscheiben und MKS-Kondensatoren gegen HF abgeblockt worden. Der Hochspannungsanschlu� wurde aus Polyamid hergestellt und hatte eine eingebaute 4 mm Buchse zur Aufnahme des Hochspannungsanschlu�steckers. Als Hochspannungskabel wurde eine spannungsfeste Ausf�hrung mit 1mm2 Querschnitt gew�hlt. Zur Kontaktierung des Verbindungskabels zur Endstufe wurde ein mehrpoliger Soriaustecker bzw. Kupplung gew�hlt, wobei der Stecker in die Geh�user�ckwand der Endstufe eingebaut ist. Netzteil und Endstufe wurden au�erdem zum besseren Potentialausgleich zus�tzlich mit 6 mm2 Erdungs- leitungen verbunden.

S�mtlich Hochspannungskabel und Anschl�sse sind sowohl im Netzteil wie auch in der Endstufe zus�tzlich mit Silikonschl�uchen versehen, was ganz erheblich zur besseren Isolierung beitrug. Damit der Spannungsverlust auf den Heizleitungen mit 5V/30 A so gering als m�glich blieb, mu�ten entsprechend starke Kabelquerschnitte verwendet werden (hier 6 mm2). Um die Ausgangs- schwingkreisverluste der Endstufe so gering als m�glich zu halten, wurden hier ausschlie�lich 14 mm breite und 1 mm starke versilberte Kupferb�nder eingesetzt. Die R�hrenanschlu�sterne sind mit flexiblen, starkgeflochtenen Kupferb�ndern zum Auskoppelkondensator C35 (1000 pF/12 KV)

verbunden.

Weitere Einzelheiten der Verdrahtung sind direkt dem Schaltplan in den Bildern 1 und 2 sowie den beigef�gten Tabellen 3 - 9 zu entnehmen.

4. Theoretische Grundlagen

Die Grundlagen dieser Ger�tebeschreibung bilden in ersten Linie die praktischen Kenntnisse und Erfahrungen zum Selbstbau einer solchen Linearendstufe. Da es aber nicht ganz ohne die notwendigen theoretischen Kenntnisse geht, die zum Bau einer solchen Endstufe erforderlich sind, wird jeder wissen, der sich schon mit dem Selbstbau befa�t. Hier sollen nur die wichtigsten theoretischen Grundlagen kurz erl�utert und dargestellt werden, die auch zum Teil bei dem Bau dieser Endstufe mitgewirkt haben. Die grunds�tzliche Arbeitsweise einer solchen KW- Linearendstufe wird hierbei vorausgesetzt. Wer dar�ber hinaus seine Kenntnisse weiter vertiefen m�chte, dem sei auf die unten angegeben Literaturquellen hingewiesen.

Wie aus der Grundschaltung in Bild 3 zu sehen ist, wird die Hochfrequenzleistung �ber ein breitbandiges Eingangs-Filter symmetrisch in die Katode eingekoppelt.

Die Auskoppelung erfolgt hier durch das vielbew�hrte selektive Ausgangs-PI-Filter. Das Gitter der beiden R�hren liegt bei der Gitterbasisschaltung, die auch grounded-grid genannt wird, sowohl gleich, wie auch wechsel- spannungsm��ig direkt an Masse und bildet so eine nat�rlich Abschirmung zwischen Katode und Anode, ohne das die R�hre ihre Verst�rkereigenschaft verliert.

Der Arbeitspunkt wird hierbei �ber eine automatische Gittervorspannung erzeugt (indem die Katode positiver gegen�ber dem Gitter gesetzt ist), die durch den Arbeitswiderstand im Katodenkreis, hier die Zenerdiode D 1, festgelegt ist. Der Arbeitspunkt ist so gew�hlt, da� sich im AB-1-Betrieb eine Katodenspannung von Uk = 55 - 60V bei einer Anodenspannung von Ua = 2600 V/DC einstellt. Hierdurch ist sichergestellt, da� sich der Arbeitspunkt immer noch im teillinearen Bereich der Triodenkennlinie befindet. Der Ruhestrom betrug hierbei 80 mA/R�hre. Die beiden Drosseln Dr. 2/3 dienen zur Unterdr�ckung von Huth-K�hn-Schwingungen, die durch sch�dliche Gitter- Anodenkapazit�ten Cg-a1 und Cg-a2 = 14 pf hervorgerufen werden. Damit die eingekoppelte HF-Leistung nicht �ber die Heizleitung zum Netztrafo (direkt geheizte Katode) abflie�t, sind zwei Heizdrosseln Dr. 4/5 erforderlich. Sie m�ssen den Heizstrom (Ih = 30 A) und den Katodenstrom (Ikmax. = 1,0 A) ohne gro�e Verluste f�hren k�nnen. Die hier erstellte Ausf�hrung hatte einen Querschnitt von ann�hernd 3,2 mm2 bei einer Induktivit�t von Lh = 2,2 mH.

Vorteile der Gitterbasisschaltung mit 2 parallel betriebenen Trioden
* Eingangs- und Ausgangsspannung sind in Phase, es sind keine Neutralisation oder besondere Abschirmungen erforderlich

* die Treiberleistung wird nicht in W�rme umgesetzt, sondern durch die Endstufe durchgereicht
* Wahl des Arbeitspunktes im teillinearen Bereich der Triodenkennlinie (geringere nichtlineare Verzerrungen und deren Mischprodukte) im AB-1 Betrieb
* durch die Parallelschaltung l��t sich die Ausgangsleistung fast verdoppeln
* einfacher Aufbau des Eingangs- und Ausgangskreises
* geringere Treiberleistung als bei Tetroden oder Pentoden erforderlich
* einfacher Aufbau des Netzteiles, da nur wenige Spannungen erforderlich sind
* finanzieller Vorteil durch die Verwendung von zwei ,,kleineren" R�hren gegen�ber einer wesentlich teureren gro�en R�hre

Als Nachteile sind zu nennen :
* Summierung der R�hrenkapazit�ten (Cga1 + Cga2), was zur Herabsetzung der Grenzfrequenz und somit zur Leistungsminderung auf den oberen B�ndern f�hrt
* Beg�nstigung von Huth-K�hn-Schwingungen durch Cgal + Cga2
* durch den sehr niederimpedanten Eingangswiderstand (Re = 62.5 Ohm) ist eine relativ hohe Treiberleistung erforderlich
* da zwei Triodenkennlinien keinen absolut gleichen Verlauf aufweisen, steigen die nichtlinearan Verzerrungen (Intermodulationsst�rungen und deren Mischprodukte) gegen�ber der Verwendung von nur einer R�hre wieder etwas an

5. Berechnung der Eingangs- und Ausgangsbedingungen

Der Eingangswiderstand der R�hre berechnet sich gem�� Bild 4.

Damit liegen die errechneten Eingangs- und Innnenwiderst�nde vor: RE ~ 62,5 Ohm, Ri ~ 1,75 KOhm

Aufgabe der Eingangs- und Ausgangs-PI-Filter ist es, den Eingangswiderstand von Zein- = 50 Ohm auf Rein~ 62,5 Ohm herauf- und den Innenwiderstand von Ri = 1,75 KOhm auf Zaus = 50 Ohm herab- zu transformieren. Da die komplexe Berechnung von Filtern den Rahmen dieser Beschreibung sprengen w�rde, kann hier nur auf den entsprechenden Literaturquellen verwiesen werden.

Die in Bild 5 aufgef�hrte Tabelle mit s�mtlichen Berechnungen und Werten f�r die Ausgangs- PI-Filter wurde nach Unterlagen von DJ6HP (Kurzwellen- und Amateurfunktechnik) und DL3CI (CQ-DL 9/80) zusammengestellt.

Die G�te Q wurde hier mit ~11 angesetzt, was in der Praxis einen guten Kompromi� zwischen hoher G�te (gro�e Resonanzstr�me und damit verbundenen Verlusten) und selektiver Oberwellenunterdr�ckung darstellt. Zum Vergleich sind auch noch die einem mit Induktivit�tsme�ger�t als Frequenzz�hlervorsatz gemessenen und

unabh�ngig von den PI-Filterberechnungen ermittelten Spulendaten eingetragen.

Die Berechnungsformel f�r einlagige Luftspulen ist in Bild 5 mit angegeben.

Die Tabelle in Bild 5 zeigt deutlich, da� sich auf den oberen B�ndern der induktive Aufbau des Ausgangs-PI-Filters schon bemerkbar macht (errechnete Induktivit�t und Sollinduktivit�t zur gemessenen Induktivit�t).
Ansonsten sind die errechneten Daten in der Gr��enordnung zu finden, die sich auch sp�ter praktisch einstellten.

Das Eingangsfilter wurde breitbandig ausgelegt und hat eine G�te Q von ~ 2.0. Auf ein weiteres Berechnungsbeispiel wurde an dieser Stelle verzichtet. So sind deren Daten direkt der Tabelle 1 aus Bild 6 entnehmbar.

Mit dem Eingangsbandwahlschalter ist auch eine direkte HF-Einspeisung ohne das Eingangsfilter in Schalterposition 7 m�glich. Es zeigte sich aber deutlich, da� diese kleine Fehlanpassung von Zein = 50 Ohm und Rein ~ 62,5 Ohm zu einer Leistungsverminderung von 10 - 20 % am Ausgang der Endstufe f�hren kann. Au�erdem wird der Intermodulationsabstand des Ausgangssignales bei dieser Arbeitsweise um etwa 5 dB geringer anzusetzen sein. Das Stehwellenverh�ltnis SWR f�r den Endstufeneingang mit diesem Eingangsfilter lag auf allen B�ndern unter 1 : 2,0.

6. Leistungsverst�rkung der Endstufe

Wie aus Tabelle 4 in Bild 8 zu sehen ist, betr�gt die Leistungsverst�rkung :
V = 10 Log. * Pout/Pin (in dB) auf allen B�ndern zwischen 9,21 und 9,81 dB.

Diese Leistungsverst�rkung reicht aus, um bei einer Ansteuerleistung von 80 - 100 Watt (auf allen B�ndern) auch noch sichere 750 Watt - Ausgangsleistung zu erhalten. Der Abfall der Leistungs- verst�rkung zu den h�heren B�ndern, ist bei dem Ansteuertransciver wesentlich st�rker ausgepr�gt (hier der Kennwood TS-515 mit bis zu 1,2 dB), als bei der Endstufe, wo der Leistungsabfall ca. 0,6 dB betr�gt. Dies ist auf den soliden Aufbau des HF-Eingangs- und Ausgangskreises sowie der Verwendung der beiden steilen Trioden zur�ckzuf�hren. Der Endstufenwirkungsgrad liegt auch hier, wie erfahrungsm�� bekannt, im AB-1 Betrieb zwischen 50 - 60%.

7. Schaltungsbeschreibung

Wie aus dem Schaltplan des Netzteiles der Linearendstufe in Bild 2 zu sehen ist, sind dort die notwendigen Transformatoren, Gleichrichter und Steuerungelemente untergebracht. Die beiden Hochspannungstransformatoren m4 und m4 werden durch Bet�tigung des

Steuerrelais d1 (Anodenspannung-EIN) &#65533;ber zwei parallelgeschaltete Widerst&#65533;nde (R4/R5 von 150 Ohm/7W) eingeschaltet. Deren &#65533;berbr&#65533;ckung erfolgt zwei Sekunden zeitverz&#65533;gert durch d2. Diese bekannte Einschaltungsart von gro&#65533;en Transformatoren vermindert den Rush-Effekt f&#65533;r konventionelle 16A/H- oder L-Automaten der Netzabsicherung.

Das Hochspannungsnetzteil ist sehr spannungssteif ausgef&#65533;hrt und beinhaltet nur leistungskr&#65533;ftige Bauteile. Als Hochspannungsgleichrichter ist ein Drehstrombr&#65533;ckengleichrichter mit 4500V/DC Sperrspannung und 1,8 A Nennstrom verwendet. Die Hochspannungsgl&#65533;ttungskondensatoren bestehen aus zwei Bosch MP-Kondensatoren von jeweils 15uF/3KV. Die erforderlichen Versorgungsspannungen von +165V/0.2A, 12V/2A sind in bekannter Form erzeugt. Alle Spannungen mit Ausnahme der Hochspannung, werden &#65533;ber eine mehrpolige Soriau-Buchse und Stecker zur Endstufe gef&#65533;hrt. Bei hoher Strombelastung (Heizspannung) sind mehrere Steckerstifte parallel geschaltet. Verschiedene Funktionen sind optisch mit Leuchtdioden angezeigt. Verdrahtungsquerschnitte sind im Schaltplan, sofern erforderlich, angegeben.

Im Schaltplan von Bild 1 ist die Endstufe dargestellt.

Da zuvor die theoretischen Grundlagen der Gitterbasisschaltung f&#65533;r zwei parallelbetriebene Sendetrioden beschrieben worden ist, sind hierzu nur noch wenige Punkte anzuf&#65533;gen. Mit dem keramischen Eingangsbandwahlschalter b2 wird das komplette Eingangs-PI-Filter f&#65533;r alle B&#65533;nder umgeschaltet. Der keramische Ausgangs- bandwahlschalter b3 ist mit kr&#65533;ftigen Kontakten (hier f&#65533;r 50 A) ausgef&#65533;hrt, um die hohen Resonanzstr&#65533;me ohne gro&#65533;e Verluste f&#65533;hren zu k&#65533;nnen. Der Plate-Drehkondensator C 36 hat 250 pF bei 6 KV Spannungsfestigkeit und der Load-Drehkondensator C37 1000 pF bei 3KV Spannungsfestigkeit. Eine deutlich h&#65533;here Spannungsfestigkeit hat der Auskoppelkondensator C 35 bei 1000 pF/12 KV.

Aus Platzgr&#65533;nden wurde auf eine Abschlu&#65533;scheibendrossel L~2,5 mH, die parallel zu C 38 - C 41 liegen m&#65533;&#65533;te, verzichtet. Diese Abschlu&#65533;scheibendrossel und galvanische Kopplung gegen Masse kann verhindern, da&#65533; bei durchgeschlagenem Auskoppelkondensator C 35 die Hochspannung an der Antenne anliegt. Da der Auskoppelkondensator eine Spannungsfestigkeit von 12 KV aufweist und sich eine maximale Anodenspitzenspannung von 8 KVss einstellt , ist diese M&#65533;glichkeit allerdings sehr gering. Achtung : Trotzdem immer einbauen !

S&#65533;mtliche Gitteranschl&#65533;sse sind mit keramischen Scheibenkondensatoren (C30 - C33 = 4700 pF) und Widerst&#65533;nden (R19 - R22 = 3,3 Ohm) abgeschlossen worden. Diese Widerst&#65533;nde erlauben au&#65533;erdem eine Gitterspannung bzw. Gitterstrommessung &#65533;ber den Me&#65533;bereichsumschalter b7 und das Anzeigeme&#65533;instrument g2. Der Eingang der Katodendrossel Dr. 1/2 s. Tabelle 3 in Bild 7) ist ebenfalls mit keramischen Scheibenkondensatoren C26/27 = 4700 pF abgeschlossen. Die Katodenspannung von 55 - 60 V (vom Mittelanschlu&#65533; des Heiztrafos &#65533;ber

den Steckerpin) stellt sich ber eine Reihen- und Parallelschaltung von Dioden (n 24 - n 187) und deren Durch- la spannung ein. Diese Dioden m ssen den Katodenstrom (hier max. 1,5 A) sicher f hren k nnen und die auch entstehende Verlustw rme Pv - UK * IK = 48 Watt (bei ~ Ik = 0,8 A) aufnehmen k nnen. Alternativ hierzu sind auch Zenerdioden, die auf einem K hlblech isoliert aufgebaut sind, einsetzbar. Da Zenerdioden auf Grund unterschiedlicher Kennlinien und Zenerspannungen nicht parallel schaltbar sind, kommen somit nur leistungsstarke Fabrikate in Frage.

Nachteilig, und das gilt f r beide Katodenspannungserzeugungsarten, ist die Tatsache, da durch die Eigenerw rmung die Diodenschwellspannung und somit auch die Zenerspannung sich etwas nach unten ver ndert. Die in der Praxis ermittelte nderung der Katodenspannung lag in der Gr enordnung von etwa 10 %. Diese Auswirkungen (die Katodenspannung sinkt um etwa 10 % ab), nach der sich der Arbeitspunkt im AB-1 Betrieb etwas n her zum A-Betrieb hin ver ndert und den Katodenstrom etwas ansteigen l t, hatte bei sp teren praktischen Messungen allerdings keine gr eren Auswirkungen.

Das Antennenrelais, eine kr ftige 12V-Ausf hrung mit 15A Kontakten, ist in unmittelbarer N he der PL-Buchsen auf Gummiringen zur Schaltger uschverminderung montiert. Die Verbindung vom HF-Ausgangskreis zum Antennenrelais erfolgte mit einem 20 cm kurzen Koaxialkabel RG 58-U. Da sich dieses Koaxialkabel vorz glich verarbeiten und biegen l t, wurden bewu t kleinere Kabelverluste in Kauf genommen.

Ein kr ftiger 230V/AC-Ventilator, der f r eine ausreichende K hlung sorgt, ist von der Frontplatte aus auf schnell bzw. langsam umschaltbar. Die gesamte Betriebsartensteuerung ist mit den 12-V Relais d3 - d6 aufgebaut und kann ber den Betriebsartenschalter entsprechend vorgew hlt werden. Zur externen PTT-Steuerung ist das Relais d6 benutzt. Eine HF-Vox-Steuerung ist nicht eingesetzt. Dies gilt ebenso f r eine ALC-Spannungsgewinnung vom HF-Ausgangssignal zur Leistungssteuerung des Ansteuertranscievers. Nachteilig war dies beim sp teren Betrieb nicht.

Mit dem Me bereichsumschalter und Anzeigeinstrument g2 k nnen folgende Spannungen und Str me w hrend des Betriebs gemessen werden:
1 - Ua, 2 - Ik, 3 - Igl, 4 - IgR1, 5 - IgR2, 6 - Uver+165V, 7 - Uver +12V

Mit dem Anzeigeinstrument gl ist der relative HF-Output (nicht frequenzkompensiert) moderat angezeigt. Im Stand-by-Betrieb wird die Katodenspannung auf + 165 V gelegt, was zur absoluten Sperrung der beiden Trioden bei Ua=2800V ausreicht. Wichtige Schaltungszust nde sind optisch mit den Leuchtdioden LED 3 und 4 signalisiert.

S mtliche Versorgungs- und Steuerspannungen werden gegen die Hochfrequenz mit entsprechenden Kondensatoren abgeblockt. Die

Anodendrossel Dr. 3 (s. Tabelle 3 in Bild 7) ist einlagig auf einem Keramikk�rper aufgebracht worden und dient zur Zuf�hrung der Hochspannung in den Anoden- kreis. Der keramische Hochspannungskondensator c34 = 5000 pF/5KV blockt hierbei die HF vom ,,kalten Ende" der Drossel ab.

8. Verwendete Me�ger�te und Me�verfahren

Folgende Me�ger�te und Hilfsmittel standen zum Selbstbau der Linearendstufe zur Verf�gung :
* 100 MHz - Zweistrahlloszilloskop, Typ: HM 512 N
* Heathkit - Wattmeter HM 102/1 KW
* Dummyload HN 31/1 KW
* L- und C-Me�ger�te als Frequenzz�hlervors�tze
* SVR-Me�ger�te 1 KW
* Tongenerator 1 - 100 KHz
* sowie verschiedene konventionelle analoge und digitale Volt- und Ampereme ter.

Leider stand zur Messung des Intermoduationsabstandes und Spektrums kein Zweitonsignalgenerator und Spektrumanalysator zur Verf�gung. Der Abstand der Intermodulationsprodukte 3. Ordnung des Ausgangssignales liegt erfahrungsgem�? bei ca. 40 dB vom Sollsignal und sollte bei Linearendstufen noch etwa um den Faktor der Leistungsverst�rkung, hier 9,5 dB, h�her anzusetzen sein, damit die effektiven Intermodulationsst�rungen und deren Mischprodukte bei gegebenem Abstand zum Sollsignal bei gr��erer Ausgangsleistung auch im gleichen Verh�ltnis klein bleiben. Beim sp�teren Betrieb der Linearendstufe, und dies wurde in vielen QSO's vom jeweiligen Gespr�chspartner best�tigt, sind keine unerw�nschten Verzerrungen oder Splatter sowie Nebenausstrahlungen aufgetreten.

Dennoch sind vor dem Betrieb der Endstufe einige Ausgangssignale oszillographiert, die mit den vorhandenen technischen Mitteln m�glich waren. Hierbei war kein sogenanntes flat-topping zu beobachten und die HP-Amplitude zeigte sich als reine Sinusform. Auch konnten keine unerw�nschten Phasendifferenzen zwischen Eingangs und Ausgangskreis, die durch falsche �bersetzungsverh�ltnisse des Ausgangskreises und deren Blindkomponenten entstehen k�nnen, festgestellt werden. Solche Phasendifferenzen k�nnen ebenfalls zu Fehlanpassungen und Fehlabstimmungen mit den bekannten Auswirkungen f�hren.

9. Praktische Betriebserfahrungen
Die genannte KW-Linearendstufe ist in dieser Applikation mit dem KW-Kennwood-Transciver TS-515 angesteuert. Als Antenne ist ein Doppeldipol f�r 80 und 40 m sowie ein Dreielement-Beam von Hygain TH3-MHK in 28 m H�he verwandt. Die praktischen Betriebserfahrungen mit dieser Selbstbau-Endstufe sind als sehr gut zu bezeichnen. Auch die Abstimung des Transcivers auf den Endstufeneingangskreis und die Abstimmung des Endstufenausgangskreises an die Antenne ist auf allen B�ndern ohne Probleme durchzuf�hren. Die Stehwellenverh�ltnisse

betragen auf 10, 15 und 20 m mit dem Beam etwa 1 : 2.0 und bei den Doppeldipolen (die nur 2 m ?ber dem Hausdach aufgebaut sind) etwa 1 : 2,0 bis 1 : 3,2.

Sehr von Vorteil ist auch die Zweistufenumschaltung des kr?ftigen Ventilators, der in der zweiten Stufe schon h?rbare Windger?usche verursacht, die bei leisen Empfangsdurchg?ngen st?ren k?nnen. RTTY- oder CW Betrieb wurde bisher mit dieser Endstufe noch nicht ausge?bt. Es zeigten sich aber auch bei langen Phonie-Durchg?ngen keine ?berlastungen der R?hren. Die Anoden der R?hren erhielten lediglich eine r?tliche F?rbung, was als ,,normaler". Betriebszustand anzusehen ist. Durch die str?mungsg?nstige Luftf?hrung wurde die Verlustw?rme auch sehr schnell aus dem Geh?use herausgetragen. Ein gro?er Vorteil ist ebenfalls die M?glichkeit, st?ndig alle Spannungen und Str?me mit dem eingebauten Me?instrument zu ?berwachen, ohne hierzu das eingebaute Outputmeter umzuschalten.

Die sichere Funktion, Arbeitsweise und Leistungsf?higkeit eines jeden Selbstbauger?tes ist hierbei auch der beste Erfolg f?r den Funkamateur.

And you have verified that the LO is working?

433. do you want to turn 6 dollars into thousand...A MUST SEE

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-02-06 00:37:43 UTC
From: "incrediblejoe@gmail.com" <incrediblejoe@gmail.com>

Source record: 8572

I found this in a news group and decided to try it. A little while back,
I was browsing through news groups, just like you are now and came across a message just like this, that said you could make thousands of dollars within weeks with only an initial investment of $6.00!!!

So I thought yeah right, this must be a scam!!! But like most of us, I was curious, so I kept reading. Anyway, it said that you send $1.00 to each of the 6 names and addresses stated in the message. You then place
your own name and address at the bottom of the list at #6 and post the message in at least 200 news groups. (There are thousands). No catch, that was it.

So after thinking it over, and talking to a few people first. I thought
about trying it. I figured, what have I got to lose except 6 stamps and
$6.00, right? So I invested the measly $6.00!!! Guess what? Within 7 days I started getting money in the mail!!! I was shocked!!! I figured it would end soon, but the money just kept coming in!!! In my first week, I had made about $25.00. By the end of the second week, I had made
a total of over $1,000.00!!! In the third week, I had over $10,000.00 and it is still growing!!! This is now my fourth week and I have made a
total of just over $42,000.00 and it is still coming in rapidly!!! It's
certanly worth $6.00 and 6 stamps!!! I have spent more than that on the
lottery!!!

Let me tell you how this works and most importantly, why it works!!! Also, make sure you
print a copy of this message now. So you can get the information off of
it as you need it. I promise you that if you follow the directions exactly, that you will start making more money than you thought possible
by doing something so easy!!!

Suggestion: Read this entire message carefully!!! (Print it out or download it.) Follow the simple directions and watch the money come in!!! It's easy!!! It's legal!!! Your investment is only $6.00 (plus postage).

IMPORTANT: This is not a rip-off!!! It is not
illegal!!! ? It is almost entirely risk free and it really works!!! If
all of the following instructions are adhered to, you will recieve
extraordinary dividends!!!

Please note: Follow these directions EXACTLY, and $60,000.00 or more
can
be yours in 20 to 90 days!!! This program remains successful because
of
the honesty and the integrity of the participants!!! Please continue
its
success by carefully adhering to the instructions.

You will now become part of the mail order business. In this business
your product is not solid or tangible, it is a service. You are in the
business of developing mailing lists. Many large corporations are
happy
to pay big bucks for
quality lists. However, the money made from a mailing list is
secondary
to the income which is made from people like you and me asking to be
included on your mailing list!!!

Here are the 4 easy steps to success:

Step 1: Get 6 seperate pieces of paper and write the following on each
piece of paper.

PLEASE PUT ME ON YOUR MAILING LIST

Now get 6 U.S. dollar bills and place ONE inside each of the 6 pieces
of
paper so the bills will not be seen through the envelopes (to prevent
mail theft). Next, place one paper in each of the 6 envelopes and seal
them, you should now have 6 sealed envelopes. Each with a piece of
paper
stating the above phrase, your name and address, and a $1.00 bill.
THIS IS ABSOLUTELY LEGAL!!! YOU ARE REQUESTING A LEGITIMATE SERVICE
AND
YOU ARE PAYING FOR IT!!!

Like most of us, I was a little skeptical and a little worried about
the
legal aspect of it all. So I checked it out with the U.S. Postal
Service
and they confirmed that it is indeed legal!!!

Mail the 6 envelopes to the following addresses:

L.R.M.
1107 Panama St.
Houston, TX 77009

A.M.R.
23645 Cora
Brownstown, MI. USA 48183

K. Costello
20812 135 Ave SE
Kent, WA 98042 USA

B. Brown
1208 Steeple Ridge Ct
McKinney, Tx 75069 USA

J.Tompson
65-54 parsons blivd apt 1a
Flushing, NY
11365

Mourgo
27 Major Mackenzie Dr.
Suite 201
Richmond Hill, ON
L4C 1G7 CANADA

Step 2: Now take the #1 name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc.) and add your name as number 6 on the list.

Step 3: Change anything you need to, but try to keep this message as close to what you see as possible. Now, post your amended message to at
least 200 news groups. I think there are close to 24,000 groups!!! All you need is 200, but remember, the more you post, the more money you make!!! This is perfectly legal!! If you have any doubts, refer to Title18 sec. 1302 & 1341 of the postal lottery laws. Keep a copy of these steps for yourself and whenever you need money, you can use it again.

Please remember that this program remains successful because of the honesty and the integrity of the participants and by their carefully adhering to the directions!!!

Look at it this way. If you are of integrity, the program will continue
and the money that so many others have recieved will come your way!!!

Note: You may want to retain every name and address sent to you, either
on your computer or hard copy and keep the notes people send you. This verifies that you are truely providing a service. Also, it might be a good Idea to wrap the $1 bills in dark paper to reduce the risk of mail
theft.

So, as each post is downloaded and the directions carefully followed, six members will be reimbursed for their participation as a list developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the #1 position, you will be receiving thousands of dollars in cash!!! What an opportunity for only $6.00!!! ($1.00
for each of the first six people listed above).

Send it now, add your own name to the list and your in business!!!

DIRECTIONS FOR HOW TO POST TO A NEWS GROUP!!!

Step 1: You do not need to re-type this entire message to do your own posting. Simply put your cursor at the beginning of this message and drag your cursor to the bottom of this message and select copy from the
edit menu. This will copy the entire message into the computer memory.

Step 2: Open a blank note pad file and place your cursor at the top of the blank page. From
the edit menu select paste. This will paste a copy of the message into notepad so that you
can add your name to the list.

Step 3: Save your new notepad file as a txt file. If you want to do your
posting in a different setting, you'll always have this file to go back
to.
Step 4: Use netscape or Internet Explorer and try searching for various
news groups (on-line forums, message boards, chat sites, discussions, etc.)

Step 5: Visit these message boards and post this message as a new message by highlighting the text of this message from your notepad and selecting paste from the edit menu. Fill in the subject, this will be the header that everybody sees as they scroll through the list of postings in a particular group. Click the post message button. You've done your first one! Congratulations!!! All You have to do is jump to different news groups and post away, after you get the hang of it, it will take about 30 seconds for each news group!

REMEMBER, THE MORE NEWS GROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!!!! (But you have to post a minimum of 200).

Thats it!!! You will begin receiving money from around the world within
days!!! You may eventually want to rent a P.O. Box due to the large amount of mail you will receive. If you
wish to stay anonymous, you can invent a name to use, as long as the postman will deliver it.

JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT!!!

Now the why part. Out of 200 postings, say you recieve only 5 replies (a
very low example). So then you made $5.00 with your name at #6 on the
letter. Now, each of the 5 persons who sent you $1.00 make the minimum
200 postings, each with your name at #5 and only 5 persons respond to
each of the original 5, that is another $25.00 for you. Now those 25
each make 200 MINIMUM posts with your name at #4 and only 5 replies
each, you will bring in an additional $125.00!!!! Now, those 125 persons
turn around and post the minimum 200 with your name at #3 and only
recieve 5 replies each, you will make an additonal $625.00!!! OK, now
here is the fun part, each of those 625 persons post a minimum 200
messages with your name at #2 and they each only recieve 5 replies, that
just made you $3,125.00!!! Those 3,125 persons will all deliver this
message to 200 news groups, If just 5 more reply you will receive
$15,625.00!!! All with an original investment of only $6.00!!! Amazing
isn't it!!!! When your name is no longer on the list, you just take the
latest posting in the news groups and send out another $6.00 to the
names on the list, putting your name at number 6 again.

You must realize that thousands of people all over the world are joining
the internet and reading these messages every day!!! Just like you are
now!!! So, can you afford $6.00 and see if it really works? I'm glad I
did!!! People have said, "what if the plan is played out and no one
sends you the money?" So what!!! What are the chances of that happening,
when there are tons of new honest users and new honest people who are
joining the internet and news groups everyday and are willing to give it
a try? Estimates are at 20,000 to 50,000 new users, every day!!!

REMEMBER PLAY HONESTLY AND FAIRLY AND THIS WILL REALLY WORK!!!

IF EVERYONE PLAYS BY THE GAME AND SENDS THEIR $1 THERE IS NO SCAM! I HAVE
LOOKED AT IT IN EVERY POSSIBLE ANGLE AND NOT ONLY ONE PERSON IS
BENEFITING...WE ALL ARE IF WE FOLLOW THE INSTRUCTIONS. THINK ABOUT IT.
WHAT DO YOU HAVE TO LOSE? THAT'S RIGHT $6! TRY IT!

It would take a pretty lousy mixer to not get some mixing action. And
since you hve an audio amplifier following it, even weak mixing action
should provide a signal.

Hence the first step is to get a second local oscillator close to the
frequency of the existing one, and then you'll hear the beat note out
of the audio amplifier if things are working to some extent. If you
only have crystal oscillators on the same frequency, they might not be far
apart enough to get much of a beat note, but you'd be seeing some cycling
of the output of the mixer (because the oscillators are beating together
to generate an output so low in frequency that you can see it rather
than hear it).

Stop one of the oscillators, and if that cycling goes away then you
know things are working to some extent.

The advantage of crystal oscillators is that you can get some 4pin TTL
oscillators cheap, and they will be strong enough to check things out.
Their exact frequency won't matter at this point but wire them up
properly and you can be fairly certain that they will work, unlike
building up oscillators from scratch. Your problem might be that
the mixer isn't working properly so only strong signals will result in output.

Once you get some mixing action then you can move one oscillator away
from a direct connection to the mixer, and treat it like a "weak" signal
coming in through the antenna.

Make an RF probe, a coupling capacitor and a diode and a load resistor, and connect it to your multimeter. (Make it a "probe" in that the coupling capacitor should have short lead connect directly to the rest of your probe circuit. You then touch the short capacitor lead directly to the oscillator, rather than running a long lead between the oscillator and the probe.) Since it's DC coupled, you won't get a reading on the meter unless the oscillator is oscillating. YOu can always verify by removing power from the oscillator, and when the needle drops, you know the oscillator has been turned off. Of course, one has to be careful because if you load down the oscillator too much, that may kill the oscillation.

If you have a shortwave radio, tune it to try to find your oscillators, to see if they are oscillating, and in the case of the LC oscillator, where its frequency is. If you don't have an oscillator at a suitable frequency, then you might not know if things are working if there's no signal on that frequency.

I think it is, because when i turn it on with an alligator clip
attached to it's output, i hear a humming sound at the nearby receiver
- which is an envelope detector connected to a LM386 amplifier. It
means that it's working, right?

Actually, i first tought, that if i would connect the LO to the mixer and attach a long wire to the antenna port, i could hear something useful that is near the crystal frequency (7159 KHz) and determine if the mixer is working or not. A funny thought i guess.

So back to your suggestion; I have a few more of these crystals and i can build a second same oscillator for this test. I will also try the cheap TTL oscillators you mentioned if the above test fails. If it doesn't work too, i think i can be sure that the mixer isn't working. (By the way, i've got the oscillator schematic from http://www.geocities.com/raiu_harrison/mwa/tech/circuits/osc-xtal.html this page (the first one))

I would like to build a diode-ring mixer which is mentioned everywhere on the net, but those toroids used in transformers are just too hard to find here. That's why i used a ferrite rod, salvaged from an old radio, in that diode mixer. Should using ferrite rods or other core materials instead of toroids cause problems?

I build the RF probe you explained on a piece of PC board (got the component values from the N5ESE's Classic RF Probe page) and when i get the coaxial cable, that is needed to connect it to the multimeter, i will test those oscillators with it, too. And i have digital meter not an analog one. But both should work OK, i think.

And lastly, i don't have a shortwave receiver but when i go to buy some stuff again, i will also get some crystals whose frequency is in the AM band in order to listen for the oscillator signal in an AM radio.

Thank you for your interest..

I had to go back and delete that log post.

This is a pyramid scheme, and it is most definitely illegal. This is an old, old, scam. In this pyramid scheme, they try to pretend to get around the law by offering a "service". The legal entities here in the U.S. do not buy that cover, and will prosecute as per a pyramid scheme anyway. This so-called mailing list service never did work as a cover, and never will. In this scam, usually only the last name on the list, the originator of the scam, is valid. The other names are made up, taken from some other pyramid scheme list, or taken from a public record like a phone book. Notice the last name on the list - a Canadian address. He thinks that he can skirt the law by living outside the US, but this is also illegal in Canada. He spammed a lot of groups, and he did not bother to create a profile. His e-mail is incrediblejoe@gmail.com.

I filed a complaint with the a complaint with the Internet Crime Complaint Center (IC3) in Canada, which is part of the Royal Canadian Mounted Police (RCMP). And the The Canadian Anti-fraud Call Centre (CAFCC). If anyone can think of another agency to report this guy to in Canada, Please do so. Is there a Canadian Attorney General?

How nice. An upgrade fee for one small enhancement (fix that should have been in the program originally) and some bug fixes. This program needs some major enhancements. These little enhancements and bug fixes every six months to a year are not cutting it. Stay away from APRSPoint. The author is ripping people off.

hxc98@yahoo.com wrote:

Well, I'm back. Still looking for a one tube regenerative receiver I
can build for myself. I did
manage to find a kit online that looks close to what I want - it's
called the Radio Ace kit.
Made to look like the old Radiomann sets they used to sell back in the
day, it looks nice,
but at $100+ it seems it was made for people with more money than
brains.

Back to the topic. I found the schematics for the Doerle Twinplex
receiver, which should do
the trick, with one exception - the tube it uses isn't one of the
tubes I have. I do have three
different twin triodes that are of more recent vintage, but I don't
know if I can substitute any
or all of them in the circuit. The are a 4BC8, a 6FQ7 and a 6BZ7.
Anybody have any ideas?

Ralph Glatt

Well the 4BC8 has a 4.2 600ma heater, it could run on 6v through a
voltage dropping resistor. It has a mu of 35 (both triodes).

The 6FQ7 is very similar to the 6CG7 (only difference is that the 6CG7
has an internal shield between the two triode sections). It has a 6.3v
600ma heater and both triodes have a mu of 20.

The 6BZ7 has 6.3v 400ma heater and a mu of 36 (both sections).

The 6BZ7 would probably be the best choice as it is the lowest power
version tube and has the most gain.

The parameters of a tube in this circuit are not that important, any
tube will work well. Adjustment of the grid leak resistor and capacitor
as well as the number of turns in the tickler coil in the detector
circuit as well as the cathode bias resistor in the amplifier circuit
will be necessary with a tube change, but even here the values won't be
critical. Anyway I'd use the 6BZ7.

Thanks for the replies. This oscillator is cool, but not what I saw
before. I tried another Google search and can't find the one I saw.
Maybe disappeared out in cyberspace somewhere.

448. 10.9 MHz IF?

Newsgroup: rec.radio.amateur.homebrew

Hi, Everybody,

Would anybody know offhand which rigs from maybe the 1960s through early 1980s era had an IF of 10.9 MHz? I have a number of 10.9 MHz crystal filters built by Network Sciences (C-F Networks) that I bought some time ago that were supposedly taken out of a ham rig and just out of curiosity wanted to know which one.

Thanks very much.

Regards,

Al W6LX

ISTR that some older Bearcat scanners used 10.9Mhz. I don't know any
other rigs using it though.

Michael makes excellent points...

Sunday I was struggling with a simple crystal oscillator I had kludged up on a protoboard for a quick project... I have been building oscillators like this on and off for over 40 years, yet I could not get this one to work... Tried different crystals... Used the LC meter to check the caps and inductor... Used a VOM to trace the circuit and measure the resistors... Had the oscilloscope and a receiver monitoring the circuit for RF... I was just tearing my hair out... My son got involved and he could not find a problem either...
As we sat there staring at the half dozen components on the protoboard I commented that the bias voltages on the FET showed that it was conducting, but not oscillating as if something was sucking the RF to ground... On a whim I said to him, pull the RF bypass cap off the 5 volt DC line... (the LC meter had showed the cap as good and close to the 0.1 mfd it was marked)...
Ahh that won't change anything because the RF choke blocks the rf from getting that far, he said...
Well, just try it..
He reached over and idly plucked the DC bypass cap off the DC input line and WHAMMO, instant loud, whistle in the receiver and the oscilloscope showed a solid sinewave...
He looked at me, I looked at him, we both shrugged and he tossed the cap into the wastebasket...
It's the little things that will drive you to drink...

So, first verify that your oscillator is oscillating - receiver or oscilloscope or RF probe to your VOM... It is not just some white noise in the radio, but a solid whistle that indicates the oscillator is working... As Michael suggested use a second oscillator as a BFO if your receiver doesn't have a SSB or CW mode...
Next, put an audio signal into the audio amp and verify that it blows the headphones off your head... Just suck some audio off a receiver to feed it...
Once you KNOW these items work then try your mixer... Start with the transistor mixer first...
Building or buying an RF probe for your VOM will be the most versatile and cost effective tool you can make/buy for these projects..

I have seen 10.9 MHz crystal filters used in RC receivers from the
60's and 70's. Don't know if it was a technical reason or just "vendor
lock-in" for the channelized crystals (that's what the modelers told
me it was).

Tim.

I had one of these moments decades ago. Short version of a very long
story, and beginning doubts about whether reality exists or magic exists:
I built a circuit that didn't work but was supposed to work. Spent a LOT
of time. Finally, on an intuitive whim I added a component that should not
have done anything, but it made the circuit work. I told my boss, we
looked at each other, and we decided it was not worth spending more time
on and accepted the modification since what mattered was that the damned
thing work and we were not going to question black cats crossing our
paths. :-\

I finally tested the circuit. I started with the transistor mixer as you said. After being sure that the oscillators was working, i connected them to the mixer and turned both of them on. When i turned on the second one, i started to hear some strong low frequency cycling, as you said before. When i turned off one of the oscillators, the sound was gone. So that shows the mixer is working, i guess.

I have seen some crystal oscillator circuits with a trimmer connected in series with the crystal. I thougt, that way i could generate some higher frequency sound. I connected a trimmer to one of the oscillators and it made the circuit output a real 'beat note'. I could change the tone frequency with adjusting the trimmer. It could even generate frequencies as high as 2 KHz. I didn't think that this small trimmer could change the oscillation frequency that much.

I also experienced some strange things. While playing with that trimmer, i found out that the mixer's power connection was lying on the table. I connected it again, but it didn't change anything. Circuit went on working as before. Is this BJT mixer capable of mixing without power applied? And even the two oscillators were exactly same, i found that one of them were more sensitive than the other one. Touching the trimmer with a screwdriver changed the frequency like 400-500 Hz, while with the other one, it had no effect.

After then, as you suggested, i disconnected one of the oscillators and moved it a bit far away from the mixer. I could still hear it from 1-2 meters away. I turned off the mixer to see if it works with this situation too, but when i turned it off, i couldn't hear the other oscillator even from 10 cm's. What about this?

I will test the diode mixer, too, but i have some problems with the transformer right now. Until then, i will play with this one and see if i can hear some real stuff with this. Do you think it is possible with this simple setup, and with a long wire?

Thanks....

Sounds like the one oscillator is not working the way you think...

Yes, a transistor is a pair of diodes nose to nose, and can mix/
rectify without being powered.. But will need power to work as
intended...

Look, take a diode and a cap and a resistor and make an RF probe for your VOM... Look in the ARRL handbook, or the RSGB, or just about any handbook for this RF probe circuit..

Cheers ... denny

I did it, but for some reason it just doesn't read anything. Doesn't
the above test show that both oscillators are working?

Thanks..

460. licence classes

Dear friends
I know, that it is homebrewing group, but as an old visitor I am sure,
that I can find help here.

I need informations about ACTUAL licence classes in european countries.

what classes, what frequencies, power and last but not least:
what happend with "old" classes when it changed to new one

(eg. in germany old classes were connected to one new (new CEPT))

thank you in advance

Message-ID: <g59ns2p0je934ud0q4ipkqrbrb9rf09u78@4ax.com>
Source record: 8450

I have an original Cobra 148GTL CB Radio. I know that i can modify it
to operate in the 10Meter band by switching the crystal to a
11.6908MHz crystal.

is anybody familiar with this mod? If so, how do i determine what
frequency each channel will be at? will i need to purchase a freq.
countert o determine what freq. will go with what channel?

Also, will my 102: whip work with 10M, or rather will it give me a
close enough SWR to suffice, or will i need to purchase a new antenna?

Any information or assistance would be greatly appreciated.

Eddie

Not sure of the mixing scheme of the cobra, so I won't comment on that part of your question. Since the 10M band is higher in frequency than CB, shortening the 102" whip experimentally should get your SWR down...but you will need an SWR bridge to check that (or an antenna analyzer such as the MFJ 259 or similar).

Scott

Phin,
In a word, no...
You need to get that RF probe working and test it on a known RF source... Seems someone in your area should have a crystal oscillator or such, that you can use to prove the probe works... Order a crystal oscillator from Mouser, DigiKey, where ever, (~$3.00) and use that as a test source...
Then you need to check that both of your oscillators are generating RF of roughly the same amplitude, and use a receiver to check the frequency of each oscillator...
Did you test your audio amp?
Then and only then are you ready to trouble shoot the mixer...

Thank you for your responses. These filters were definitely from the very early 70s or maybe mid- or late 70s. The guy who sold them to me at the swap meet mentioned that they may have come out of a Cubic or Astro rig of that era, but he wasn't sure and I just wondered if there was anybody here who might be sure of that.

Thanks again, you guys.

The name of the filter manufacturer that you mentioned, that did sound
like the company that made the Swan filters (Cubic and Astro came later
in the seventies, but my hazy memory connects them all together so I
think there is a connection). I remember ads (and a quick check
didn't find one) of them touting a really good filter made by
that company. But I'm pretty certain it was in the 5MHz range.

What does come to mind, maybe incorrectly, was that the Swan 250, the
six metre SSB rig, had a 10.7MHz IF, but I can't be bothered to check that.
I can't even remember why I would think that. But I can't see them going
to 10.9MHz.

I'm with the others, 10.9MHz is most likely a scanner (and I too would
say Regency). And if it's not that, then it's some non-amateur piece
of equipment. Not everything has to be for ham radio rigs, and I have
my share of oddball crystal filters that came from somewhere but
couldn't have been ham rigs.

Load the inputs and outputs down to some extent, and then use a sweep
generator to get a general idea of their bandwidth. If you're looking
for SSB-width filters, then they aren't useful if they were for FM
receivers.

Post the information printed on the filters, and maybe someone just
happens to know.

Hi, Michael and others,

Ron W6ZI was kind enough to solve this mystery and respond with the
following:

"The 10.9MHz C-F Networks filters were used to replace the standard filter
in
the Swan 250. The 250 had a 10.7MHz I.F. so a bit of retuning was required.
The stock 250 filter was a 4 pole, 3KHz (more or less) B.W. while the C-F

was an 2.8KHz, 8 pole which provided a very noticable improvement. Hope this

helps."

Thanks, Ron.

Regards,

Al W6LX

Hello all, I'm trying to put together a 50 MHz preamp for a
transverter project I'm building and I can't seem to get much gain
out of two separate designs I've tried. I built AA3SJ's amp that's
on the front end of his transverter (http://www.qsl.net/aa3sj/Pages/
50MHz-Xverter.html)
and I even tried Hamtronics' design (http://www.hamtronics.com/pdf/
Manuals/LNK%20Preamp.pdf)

Does anyone have a proven design for a VHF preamp using BF998's or any
help? Thanks.

That design looks OK to me, though I haven't tried calculating the resonant frequency of the tuned circuits. Do you get nice resonant peaks in gain when varying input and output caps ? The 2 pF output coupling capacitor is intended for a very high impedance load (the 2nd BF998/mixer) so may not work for a 50 ohm load if that is what you need. I would probably try a one or two turn link on L2 for output coupling to 50 ohms.

> and I even tried Hamtronics' design
(http://www.hamtronics.com/pdf/Manuals/LNK%20Preamp.pdf

Very similar design except it seems the output is untuned and very heavily loaded (by the large coupling capacitor C6), and has a 47 ohm resistor in the output for stabilization.

The BF998 has good gain past 1 GHz. For stability, it is probably necessary to design this like a microwave circuit: very short leads, use only chip capacitors for bypassing (and chip resistors, at least AA3SJ's R3 and Hamtronics' R4), double sided circuit board with full ground plane, ground the source lead of the package within 0.1" of the body of the BF998, either directlly to the ground plane or to a top-side pad which is grounded with at least two wires or eyelets or plated through holes to the ground plane, within 0.2" of the BF998.

I assume you haven't got gates 1 & 2 reversed ? (input to gate 1, 3 or 4V or so bias to gate 2)

Other things to check:
-is the gate 2 bias voltage correct (roughly 3-4 V) ?
-is the drain current on the order of 10 mA ? (that is where the BF998 noise figure is specified)
-are the inductors used exactly as specified ?(absolutely must be either toroids or in shield cans to avoid feedback, I think)
-is the amplifier oscillating ? (look for RF voltage on the output or hold an antenna connected to a frequency counter or spectrum analyzer up to the coils, or look to see if the supply current jumps when you tune the input or output.)

Good luck. I'd be interested to hear what works as I've just acquired some BF998s to play with !

73,
Steve VE3SMA

475. Continuous Phase Modulation

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-02-11 21:42:53 UTC
From: W3JDR <joe@roccis.com>
Message-ID: <x5Mzh.1993$ov2.729@trndny06>
Source record: 8464

Does anyone know if continuous phase modulation (CPM) of the RF carrier will work with PSK31 systems?

In most current embodiments of PSK, a raised cosine shaped pulse is applied to a balanced modulator which is driven by the RF. This has the effect of gradually lowering the amplitude of the RF envelope as the point of 180 deg phase reversal occurs . This minimizes the number of sidebands which would otherwise be generated if a discontinuous 180 deg carrier phase reversal were allowed to happen during full carrier level. It also causes the transmitted signal to have an amplitude envelope which must be preserved, otherwise spectrum spreading will occur.

The DDS chips used in a lot of new QRP designs commonly have a programmable phase-offset register which adds a constant phase offset to the RF carrier generated by the chip in very small phase steps. It seems to me that a very well-controlled, constant envelope phase modulated signal could be generated by sequencing the phase offset register through all the values in a raised-cosine pulse prior at the transitions of each transmitted symbol. This would result in a very simple, bandwidth-efficient, constant-envelope PSK31 transmitter implementation in QRP rigs that employ DDS.

Someone suggested to me that the DSP decoder systems used in most PSK31 software require an amplitude envelope in order to derive sync. However, the DSP decoder probably implements narrow-bandpass filtering prior to the detecion process, and this narrowband filtering of the constant-envelope PSK signal would probably restore the envelope anyway, so it should work.

Is there a flaw in this reasoning?

Joe

No flaw in the reasoning, but some ambiguity in the assumptions. This
is something that you'd have to try and see how it works.

On the plus side, the classical method of deriving bit synchronization
in PSK isn't sensitive to the amplitude of the signal; if that is what
was used in your system then you're home free.

Yes, there IS a slight error in the rational.

If you consider the phase constellation, a constant envelope implementation of PSK will require more bandwidth. The paths from one constellation point to another are more direct with the classical non-constant envelope approaches. To keep the envelope constant, the constellation trajectory must stay on the unit circle (and sometimes even pass thru other possible symbol states). Since the constellation trajectory must go a larger distance in the same period of time (gotta get there in one symbol period!), more bandwidth is required. Things have gotta be able to happen faster in the I and Q channels.

Dan

478. navtex receiver/AM receiver sensitivity

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-02-12 18:19:34 UTC
From: bigorangebus <bigorangebus@yahoo.com>
Message-ID: <1171304374.688481.68040@q2g2000cwa.googlegroups.com>
Source record: 8467

Does anyone have any tips on increasing sensitivity for a medium wave receiver trying to distinguish navtex 170Hz phase shifts on a low power carrier at 518kHz?!

Ive been on and off trying to do this project for my boat for a year. I say off and on, its become most frustrating! I can't use a loop antenna because its just too big and too directional for use on a boat. So I'm currently using a Nasa Marine active aerial (it is just a small plate attached to a standard fet common source driver circuit). I have that going down some coax through capacitive impedance transformer and inductor creating some extra front end selectivity, to the input of a 612 mixer, getting 6kHz IF (after being mixed with a lo). I'm driving the 612 differentially, as its a slight improvement over single ended. From here Ive tried using several op amp filter circuits, and they all perform adequately.

Heres my problem, the receiver just picks up too much noise. Everything interferes with it, even the scan on my oscilloscope. Even without this, taking the aerial out of the room, the actual noise in the system is too high to pick up anything but the strongest navtex signals (which are decoded). Of course AM radio broadcasts are way above the background noise, and navtex signals are much lower power. And AM radio has the help of our ears to tune out the noise.

It works better when closer to the transmitter of course, but the navtex spec says you should be able to pick up stations 400 miles away, and i'm only just decoding the local one 100 miles away.

So my question is, does anyone know of any special techniques on the RF side that can improve my noise handling/signal integrity? (my expensive sony worldband receiver seems pretty good at it on SSB). And....does anyone know how the upper market receivers get such a good signal? My receiver just samples the input frequency (as does the Nasa low end I think), so is very susceptible to any interference.

Grateful and very interested to hear views on this.

Many Thanks
Andy

I've already answered this on sci.electronics.design. Please get onto
Wikipedia and read their article on "cross posting". They'll tell you
about "multiple posting" in there, which is what you've done.

Cross posting is often appropriate, when you have an item of interest to
two or three groups.

I can't think of a case where multiple posting is appropriate, and it is mildly but generally frowned upon, to the extent where normally mild-mannered newsgroup denizens will suddenly appoint themselves as net cops and write posts like this one.

The use of CW on the bands has nothing to do with testing requirements.

CW will live undoubtedly under the category of CW, RTTY/Data

And did you know that CW can be legally used on the "Phone Bands" ?

Example from ARRL URL:
http://www.arrl.org/FandES/field/regulations/allocate.html

General class:
14.025-14.150 MHz: CW, RTTY/Data
14.225-14.350 MHz: CW, Phone, Image
Advanced class:
14.025-14.150 MHz: CW, RTTY/Data
14.175-14.350 MHz: CW, Phone, Image
Amateur Extra class:
14.000-14.150 MHz: CW, RTTY/Data
14.150-14.350 MHz: CW, Phone, Image

I assumed that not all radio amateurs would read electronics, and vice
versa, sorry if this is seen as inapropriate to post in the two groups

484. killing cars with high RF?

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-02-12 23:17:50 UTC
From: KE5MBX <nelson.blaha@gmail.com>
Message-ID: <1171322270.786928.164360@a75g2000cwd.googlegroups.com>

Hi,
What's all this business I hear people talking about blasting people's car stereos or killing cars altogether with high-power RF? I run 2m, 10m, and 11m in my jeep and I'd like to sort out the fact from the legend and find out what kind of power I can use without risking damage to my jeep or cars around me. At what power level is front-end overload to a nearby radio likely? At what power level is damage likely, and to what componets?

I am currently using only 50 watts on a 5/8 wave (2m), 25w on a 1/4 wave (10m), legal 4w on a 1/4 wave (11m)

Thanks,
Nelson KE5MBX

485. Re: Help with BF998 preamp

Thanks for the help. Well, I can see now on the spectrum analyzer that it's oscillating. I also found that the input wasn't tuned right. I now get around 20 dB or so
of gain but I can't seem to get rid of the oscillations. I put a slug tuned inductor (.3uH
7-1/2 turns) on the output in place of the toroidal inductor (9t on a T30-6) but tuning it doesn't do anything.

In this version of the Hamtronics amp, I'm using 1206 size R's and C's and the BF998
is a SOT style package. Everything is close to the device. I tried putting a shield made of sheet brass straddling the G1 lead, going across the width of the board, I tried changing the R on the drain lead and I put a SMT ferrite bead on the drain lead but it's still taking off. I built this amp on a single sided board - could that be my problem? Should I have built this on a double-sided board with vias?

In the meantime, I'll try to build one on a double sided board and drill some holes
and wire the grounds to the bottom side.

Thanks much for the help. If I get it working, I'll post some pics and a schematic.

Curt, K8AI

Posting the same message on more than one group is perfectly fine. It's
the way you do it. What's inappropriate is to post the same message to
more than one group _separately_. Even with Google Groups you can
cross-post, which puts the same message on multiple groups, but with the
message tied together so that all groups get all the replies. This
gains you considerable synergy, and keeps folks who are on both groups
from answering the same things twice.

You should be able to do a web search to figure out how to cross-post
from Google -- check the link in my sig line, it may even be in that FAQ.

Some research with the Radio Amateur's Handbook, notably the
sections on field strength and RFI, coupled with what you should already
have learned during your license course study, should provide all the
answers you need.

Happy hunting.

489. Re: When is a hybrid not a hybrid?

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-02-13 14:47:39 UTC
From: Ian White GM3SEK <gm3sek@ifwtech.co.uk>
Message-ID: <Gue16yPL+c0FFA8D@ifwtech.co.uk>
Source record: 8478

Thanks for all the interesting replies - particularly Len's long historical narrative - and please accept my apologies for not responding immediately. The magazine article took a different course from the one that I'd anticipated, and thus took much longer to write.

After all the research and reminiscence, though, we still aren't much closer to understanding why some old-time telephone engineer named this circuit a "hybrid" . We can only speculate that, before finding his true vocation with Ma Bell, he had failed both English and Genetics.

In the end it seemed more important to concentrate on the defining characteristics of a modern "RF hybrid", which are coupling between some of its ports (usually equal power division), and at the same time, isolation between other ports. Even that is more of a loose consensus than a firm definition, of course.

Anyhow, the article eventually started with a fairly detailed description of the telephone hybrid (which also explains why a hybrid can sometimes be called a bridge instead) and then wandered onward to identify a few RF hybrids and describe some useful applications of RF hybrids; by which point, I had used up my two pages.

Thanks again to everyone who contributed - it certainly helped to straighten out my thinking on what had originally seemed such an innocent little question.

490. Simple wideband audio amplifier circuit?

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-02-13 16:14:40 UTC

Message-ID: <1171383280.535643.3860@v45g2000cwv.googlegroups.com>
Source record: 8479

Hello,

I have been looking around the web for a complete kit for an audio amplifier, for a circuit that I am building that needs to have a wide, flat as possible frequency response (0Hz - 100Khz). Need to be able to bring 400mV up to line level. I have seen several kits based on a LM386, but I can't find any specs that show that circuit is reliable beyond 20hz - 20Khz. I am a beginner, so keep that in mind when responding.

But you may be looking for the wrong thing. That's not an audio amplifier,
that's a wideband amplifier. A good op-amp is likely going to be what
you want, because line level is no more than a volt (if even that), so
a gain of about 3 is going to be enough. Of course, if you are driving
something out of the ordinary, that may require something more.

Andy, you may hate yourself after reading this, but there IS
a solution to improving signal-to-noise ratio with a loop:

Mount it HORIZONTALLY. :-)

A loop can be an advantage when it has an electrostatic
shield included in it. The pattern will be roughly omni-

directional. With horizontal mounting it won't be high to hit either sail booms or be taken away by wind as easily as a vertically-mounted loop.

In 1967 I proved that to myself with a 60 KHz loop intended for the new WWVB service from (then) NBS (now NIST). 13 x 13 feet in the attic space above my house' center room. Had lots of noisy appliances in the house then, plus harmonics from old tube-type TVs' horizontal sweep (two). Good signal despite all that, just didn't have the good digital hardware to decode it. BTW, a roll of Reynolds' Wrap aluminum foil was sacrificed to make a nice electrostatic shield over #12 AWG electric power wire used for the loop itself.

What I use now is a vertically-mounted loop of #14 wire 2 1/2' in diameter, tuned to 60 KHz. The resonating capacitor for tuning is 10 feet below the loop, using some of 75 Ohm coax capacitance as part of that tuning. Balanced tuning with coax shields together as the center common, aluminum foil as an electrostatic shield connected only to the common. Works well to Fort Collins about a thousand statute miles away.

An "AM BC Band" tuning is easily possible although the number of turns will be reduced (and thus cutting down on developed RF voltage output), but lots of those have been made by others over the years. Mounting the loop horizontally might cause a slight detuning but nothing severe and be roughly omnidirectional so the boat could be in any heading without changing signal strength.

Good luck on that,

LenAnderson@ieee.org

Heh heh heh, the etymological problems can be furthered
by looking at other terms in all of electronics and how they
came to be known. :-) Sometimes we just have to plain
accept common terms rather than buy industrial-strength
aspirin quantities to ease the ensuing headaches. "English"
(our supposed 'common' language) has, like most other
languages in Yurp, grown, adopted, changed, mangled,
seasoned, and baked thoroughly by common folk for
centuries in daily use. The only "correct" use seems to
be that authorized by our school teachers... :-)

How about posting in here when the publishing schedule
is firm about which issue the article will appear in? [he

said, mangling sentence structure] Might be a fun future
topic for discussion? :-)

LenAnderson@ieee.org

And for the third time, you still ignore part of the hierarchy.

While the first RFD ignored the hierarchy except for .misc and .policy,
and the second RFD added .antennas and .dx, this third RFD long after
the discussion started still ignores three of the newsgroups in
the hierarchy:
rec.radio.amateur.boatanchors
rec.radio.amateur.digital.misc
rec.radio.amateur.space

In the end, you can't speak for the hierarchy if you don't even
know which newsgroups exist in the hierarchy. No wonder you have
such disregard for the hierarchy, you only think of yourself as some
"administrator" type rather than a participant.

You aren't building bridges, you're imposing your vision on the hierarchy.
The fact that you still don't come to the hierarchy and simply talk to us,
isntead hiding behind the structure of creating a new newsgroup, says
everything about your relationship to newsgroups.

IN the end, I conclude that you like moderated newsgroups because Usenet
never sat well with you, and the only way you can deal with it is impose
your need for rules on something that is a haven from that.

Ultimately, you are like the problem posters. Neither of you can live
without rules, though you need them because you can't tolerate the lack of
rules, while they need them because they think the lack of rules is license
to do as they please.

You've spent the decade trying to impose rules on the hierarchy, while
the rest of us were actually trying to make the hierarchy good by
participating in the discussions.

Useless administrators are always trumped by people doing things.

Who's definition of line level? For consumer audio gear, line level
is 0.1 milliwatt into 1000 ohms, or roughly 320mVrms. If your source
impeadance is sufficiently low (most gear has input impeadance in the
several-thousand ohm range), you're done.

If you need it for studio gear, then you've got to get your singal up
to 2.5 milliwatts into 600 ohms, or about 1.2 Vrms, and any of a
million op-amps can give you the gain you need to reach those levels.

The ubiquitous 741 is cheap and easy to use, but the now 40-year-old
design is kinda noisy.

I cannot imagine that a 386 would be a good match just because it's
designed for much lower output impeadance and much MUCH higher levels.

Computer software consists of only two components: ones and
zeros, in roughly equal proportions. All that is required is to
place them into the correct order.

If you are using TeraWatts of output power (unlikely) or wish
to detonate a nuclear device (for its EMP or Electro-Magnetic
Pulse), you are not going to blast anyone's rig or ruin their
auto boom-box or even harm their ignition from a ready-built
amateur radio rig.

As the good "doctor" said, your ham radio test should have
clued you in on what is considered "harmful" to humans.
How about reigning in some hysteria and folk tales and
concentrate on actual building-testing-slinging-solder
radio-electronics instead of some fantasy notions? :-(

The trouble is, there just aren't enough words to go around, so innocent
little words - "power", for example - are forced to totter under the
weight of a dozen different definitions.

I would have to say yes, since CW has always been allowed on ALL amateur
bands, from the bottom end to the top end of each.

There are many times when "high" power has disrupted other devices.
The early car computers have been know to shut down with 100 watts of
VHF. Worked on a police car that the engine would shut off when over
80 mph and key the radio.
A friend would be taking on his 1KW mobile as he pulled into his
driveway. He would find his base radio receiver front end blown. Took
three times to think it through and as he should have been doing,
switch his base antenna (dipole over the driveway) to ground, when not
in use.

FYI - THat is no longer 100% true since the spot frequencies on 60M are
USB only.
And 6 and 2 are the only places with CW only bands.

Isn't that just ordinary RFI/EMI that can happen in a house
environment? :-)

Don't expect auto makers to RFI-proof their wiring without an
extra kilodollar add-in to the sticker price.

Oops, forgot about 60M. Not sure about 6 and 2 being the only bands
with a CW only portion. Maybe a better choice of words would be
"non-voice portions" since it appears that the HF bands still have
segments designated for rtty and data. ???

IMHO that was a mistake. It was because the U.S. voice portions of 80m and 40m where inacessable to ITU zone 1 hams. So putting the data and rtty in them would have slowed down their growth.

Tune across the high end of the old 80m and 40m CW bands, and you can see what I mean. from 7100 down, it's almost unusable due to digital signals, some nights as low as 7050. The same thing with 3850 which is the top end of my 80m band.

Yes, we now have 7100-7200, but it's not much good for DX yet. It's still filled with high power SWBC stations who have no intention of moving. When they are off the air, there is no propigation. :-(

To veer this discussion anywhere near the topic. If you asked because you are thinking of building a CW only rig, don't worry, it will be usefull for a long time to come.

Geoff.

In Montana, there was a Sage radar, 5MW pulse power, which would zap
your car radio when the beam crossed it. Fortuneatly this was in the
60's before the electronics control of your car's engine. The solution
was to tilt the radar antenna up 5 deg. so both the town and the highway
that passed in front of it were not impacted. Even so, I have tape

recordings from that era which have a little zap in the every 12 secs as the lobes passed through town when the antenna rotated. Oh yes, and before the antenna was tilted, flourescent lights would also blink.

I think you'll get your best help if you ask this on
sci.electronics.design, it has a lot more traffic.

I'd definitely use a good op-amp, and definitely NOT an LM386
(single-chip audio power amp, meant to drive a small loudspeaker). The
manufacturer's page here:
http://www.national.com/pf/LM/LM386.html
gives distortion as 0.2 percent, which is pretty bad by modern
standards. The soundcard and a good op-amp will surely give much
better performance.
You said in your original post you want response to DC (O Hz). All
the soundcards I've heard of are capacitively coupled, and have a
rolloff of around 5 to 10 Hz at the best, and even when this is
removed, the DC performance of such cards isn't guaranteed. It might
be better to use an "industrial" interface card such as made by
National Instruments.

About 2 years ago I was in a rather frivolous mood, brought about by a drop of absolute vodka. I wondered just how certain things reacted when put in a 750 Watt microwave oven.

I first tried a new way of burning a CD. Amid sparks and a pyrotechnic display that appealed to my sense of pissedness, it sort of got crazy-paved. After about 20 seconds I had to switch off the microwave because of the stench.

Then I turned to more "electronic" things. A Fujian MP3 player bit the dust instantly. Basically there was one huge "wooooofff!", then the PCB set fire to the plastic case after about 30 seconds.

Then I tried an old hamradio rig. It was an old Trio (Kenwood in the USA) 2200GX, crystal-controlled rig, with a rubber-duck antenna, and a battery compartment that had not held batteries for several years. I put it in as it was, but without the mic. Battery door open, rubber-ducky antenna on.

It sat there for about 15 seconds before anything happened, then the front panel sparked a bit and caught fire. The front panel looked similar to the CD, but a bit more melted-down, and the knobs had changed to a totally new shape. But apart from that, the radio itself still worked fine after a 30 second 750W cook. It just looked more of a mess then it did originally.

Out of interest I tested it. I was expecting RF to get in the antenna and coarse its way through the PCB, but no! The RF sensitivity was 1.25uV PD for 20dB sinad. Perhaps that was 10dB down, but it was still quite useable The TX was still delivering 1.5 Watts.

I took off the case and tried again, and THAT killed it for sure. After only 10 seconds the PCB "whooffed", with loads of sparks and spitting.

But the point is that you cannot couple more power into a rig than that, even with the cover on. The antenna was connected, and 750 W did not kill it instantly, as expected. These rigs are far more resilient than one would imagine.

Religious Practices

This is a little confusing, but hold on, and I'll try to explain it. There are many parts to my religion. We call them, parts, but we can also call them, practices, some of them, but not all of them.

We have the fundamental 'root' practice, which is sexaling. From the root practice, comes all other practices.

There are side practices, and there are derived practices. There are also, accompanying practices. There are many other types of practices, but I don't remember the names for them all, right now, as I'm still

amnesiatic, and will be for a long time.

Fistiker Practice

Bringing about orgasming in another person is a fistiker practice. A fistiker practice is a side practice, but it is also something a little different from a side practice, depending on how you bring the orgasming about, and depending on how many people are involved, and depending on who is the primary person, the person whom we are working on, and who are the helping people, the people who are joined together, to help the primary person to orgasm. There are a number of other dependencies as well.

What Is A Dependency?

A dependency is some thing that is needed that will help to define something else.

As in the case of an accident victim, we have a crutch to define one level of severity of an accident victim's situation. But we might also have a wheel chair to define another level of severity for the same, or other, accident victim. These objects help to determine how badly or miserably a person is injured.

A crutch can help define a level of severity in the injury. A wheel chair can help also to define a higher level of severity. These are both dependencies. They help us to define something, and they are used to help us to define an accident victim's level of severe injuries.

When Sexaling

You can use your lips, for example, or your tounge to twiddle the toes of a woman, and the woman begins to orgasm. That twiddleing of your tounge on her toes to help her to erotem, and to experience erotistical orgasming, can be any number of things, depending on the involvement and complexities of dependencies.

Rubbing the vaginal face, the vaginal wall, or rubbing to either side of the vaginal crevice, the labial folds or felates, can help a woman to erotem and erotistically orgasm, and depending on the involvement and complexities of dependencies, the dependencies can be any number of things, if we try to define the sexaling activity more fully and completely.

We'll skip this for now, as it is a little too difficult to remember, right now. Just remember, the primary practice is sexaling, and that sexaling is like the roots of a tree. All other religious practices grow out of the 'roots' of the tree, sexaling, and can be defined in many different ways, such as a helping practice, a side practice, a subsidiary practice, a canceling out practice, an accompanying practice, and there are many many other terms for what kind of practice some thing is, depending on what dependencies are involved.

Labia And Felate

What is the difference between a felate and a labia?

A felate is the skin tissue of the outer surface, and some of the tissue of the tips and edges of the labia. It does not include the inner side of the labia, but only the outer side, and the surrounding edges, as far as I can remember.

A verb, or action word, as I call it, is 'felate' as in 'Felate that woman's or girls' left felate'. That means to suckle on the left felate of the woman or girl.

Felate is a verb, but it is also a 'nominal' word, or naming word for objectifying an object.

Do we say 'Labialize that woman's felate!' To labialize something is to make something into a labia. We wouldn't, unless we were a doctor, say that about a felate. But we might say it if we were doctors, and we had a woman who met with a bear, and the bare clawed at her genitals, and the sharp claws ripped her labial skin up, then we might say in a surgeon's room 'Labialize that woman's ripped up labia.' That would mean to stitch it up, and make it nice and neat, and clean and well stitched up, and then useful to her, again, and it would involve a lot of surgery, as many nerves would need to be connected, as they had been ripped apart, and the wiring was all dislocated. But in the end, we would be able to fix her labia, and her genitals, if they were also hurt, and then we could dismiss the patient from the hospital, after the labia healed, and after she recovered from her trauma of having her labia shredded by an impolite, rude, mean, uncaring, and hungry bear.

Genitals, Titties, The Labia, And The Many Sexaling Organs

The labia is not the genitals, but some people do consider them as a part of the genitals. The genitals are inside the woman's vagina, in my way of thinking. The vaginal wall is not part of the genitals. The vaginal orifice is part of the genitals of a woman. This seems odd, doesn't it. Well, that is how it works, in my brain, and I designed women, as well as men. If you notice, in my writings, I've talked about the draft table, and the throttle. These are major parts of a woman's genitals. They are inside the vagina, and you can reach them through the vaginal orifice. Before you get inside of the vaginal orifice, there are a few things outside, such as a pee tube, and an ejaculate tube, and the clitoris, as well as the labia. These are not part of the genitals, but are working parts of her sexaling organs. A woman's or girls' sexaling organs are not equal to her genitals. Genitals are for baby making, and for other purposes. Titties are not part of the genitals, but they are part of the womans' sexaling organs. This will require a long discussion to clear up, so I will save it for another day.

Bears In The Woods

That's the way it happens some times, when women or girls go out into the woods, and sexal with their female friends. They can get hurt by

bears, if they are not accompanied by men, who are tough, and strong, and who stay alert, to guard and watch out for dangerous animals, such as bears, wolves, cayotes, bobcats, puma, and even racoons. Racoons do attack humans, if they smell some thing that will taste good to the racoon. If a person has a skin tear, and is bleeding, even a tiny bit, the racoon will smell it, and come running, and then find the person, and so will panthers, and all kinds of animals will come, and it's just like a bunch of sharks and fishes of different kinds, and Moray Eels, they like the smell of blood, and they come and investigate, when they smell it.

Women and girls have periods, and it is not every twenty eight days, as I've explained about before, and blood runs down, out of their vagina, and they generally do not know it, as it is only a tiny drop of blood, or less, most of the time, and the blood is often wiped from the skin surface, when the woman or girl is on the potty, or toilet, and the woman or girl will not even see the tiny drop of blood that comes out of the vagina and drips down the labia, on the inside, and then falls or dribbles down to the felates, and then falls off the felates, while she is on the toilet into the toilet, or while she is out doors, and walking about, onto the earth, if the woman is walking on a park walkway, or bicycle path. If she is wearing underwear, it will not fall onto the earth, but it will dry up on the panties, or underwear, and the smell of the dried blood will attract wild animals if she is out doors, walking or jogging in a wooded or regional or rural area, where there are lots of, or even just a few, animals.

Pumas can smell the blood, from miles away, and so can tiny oselots, and bears, and many animals can. They can smell blood, because they know they need meat to survive. That is built into their brains, that are located throughout their bodies, and not only in the skull, and animals are very sensitive to the smell of blood, as well as to the smell of urine, and to the smell of poop. Some animals, such as racoons, will come up from behind a woman, and grasp at her panties, as the racoon may smell the odors of fecal matter, from her butthole. Men may be raked by the claws of raccoons from behind, as they smell the odors of fecal matter, and try to find out more about it, as the racoons know that there is something delicious hiding behind those odors from the buttholes of women, girls, men, and boys.

Expecate

When women and girls go out hiking, it is best to wash out the vagina, first, and then use a fermented oil, as a douching agent. The oil will help to slow the flow of the blood down the inner walls of the vagina, and it may help to trap the blood, and make it difficult for it to leak out, unless the amount of the flow of blood, is very large. In that case, it is best to stay home, and not go out, when a large amount of blood is expecated from the vagina. Expecated means to expell outwardsly. Expectate can also be used, as it is generally the same word, that is, and it also has generally the same meaning, but

perhaps it has a few more uses, maybe, but it is from a variant language of the English language, and is basically the same word.

You should expecate your fluids in your vagina, from your vagina, before you go out hiking. If you know when your period is, and there are ways to tell when you have a period, or when you know when you are about to have a period, than if you normally have a large amount of blood flow from your vagina, as that has been your experience, it is probably best to go and sunbath at the beach, far away from wild animals and their habitats, or by the pool side. Racoons sometimes come out of the woods, to the shores of beaches, and trumbel along, listening and watching, and sniffing the air, when they smell dried blood, or wet or moiste blood, inside of the swim suit lining in the groinal area.

How Do You Tell When Your Period Is?

To learn when your period is, you need to look into the toilet bowl that you pee into, and then see if there is any red droplets. You can place a piece of toilet paper onto the surface of the water, and it might help to show the redish color mixing with the urine.

Another way is to take a piece of toilet tissue paper, and wipe your felates, in the morning, or during the day, or at night. Night is a good time, but during the day, it is just as good. Some women like night time because they feel the day is finished, and they are now going to make a final check. Well, it doesn't always happen the way we want things to happen. You might start leaking blood fluids, at two or three or four or five, a.m., or at six, or seven, or eight, or while you are in the shower, or in the bath tub, bathing, before you plan to go out for the day.

It may take you several years for you to find out when your period begins, and when it ends, by checking for blood flow. When you have determined the number of days between one period and the next, and you are absolutely certain of it, and you have confirmed it, many times, and you have checked to see if there might be something you didn't notice, at other times, when you checked, eventually, you'll learn when your blood flow begins, and how long it lasts, and when the next blood flow begins. Once you know, then you can time your excursions to the woods, or to the beach, with your friends, both women and men.

Bears, Wild Animals, And People

Men are needed to help scare bears away, if they come to close, and pepper spray is a good way to get them to leave the area. Bears do not like the small of pepper spray, and you need a cannister of pepper spray that will fire fifty to eighty to one hundred and eighty five feet or more, to scare away a bear, safely.

Loud noises surprise bears, but hungry bears get angry and feel challenged by you, and may come at you at a fast pace, and not stop, once they are angered. If you are a good shot with a rifle, and you

see a bear, from a few hundred feet away, and it is moving slowly, towards you, following you, you can shoot it with a good fifty calibur weapon, from that distance, and it will go down, in an instant, if you hit it square in the noggin, about one inch or less above the nose.

You need to be a good shot, and several people should aim, and fire at the same time, to kill the bear, to be sure some one hits it, and then puts it down, and kills it.

Do not think that because you have one rifle, or two handguns, and a rifle, that you are safe. If you do not know how to shoot, and if you are an inexperienced marks woman, or marks man, than your chances of hitting the bear are near zero, for all three of you, at three hundred feed.

You need years of practice to become a good marksmen, and you can start with the lower calbur weapons, to get a feel for weapons that fire projectiles, and that make loud noises.

There is no such thing as a friendly bear, and people think, 'Oh, look! Isn't she cute, that bear.' If they think that way, they might as well have left their last will and testament behind, and signed all their assets over to another person.

Bears are animals that need to eat just as humans do, and just as all animals do. If you are so foolish to think that bears are cute, you are a lame brained idiot. Bears are dangerous animals. And so are all wild animals. If you think a racoon is a cute animal, you get the lame brained award for the year award, and trophy to sit on your desk at home to remind you of how stupid you are.

Brad Pitt, And Angelina Joline

Only idiots would think that wild animals, that eat people, are cute. They need remedial training, as they do not understand that their lives are in danger, every time they walk out the door of their home. Even in the cities, there are nasty people, who smile, and pretend they are your friends, and these same people, such as Hillary Clinton, Brad Pitt, Cheryl Davis, a friend of Brad's, but that's his current girl friend, Angelina Jo-line. She is not a Lesbianist, and Brad pretends to be her friend. He likes to watch her get eaten by bears, my abominant kids, when the Lesbianists feed humans, one at a time, to the bears, or to the crocodile abominant children of mine.

Abominant Elephant Kids

I have carniovorus, human being abominant elephant kids, and they are rude, mean, nasty, and really terrible. They scare people, and then they pick them up with their trunk, and place them on their head, and then they tell them not to move, or they will stample on them, or tromp downwards, and crunch them, painfully, from the foot, to the shin, to the thigh, to the pelvis, to the waiste, to the lower tummy, to the mid section, to the chest, and then the neck, and then the

head, finally killing them. They will take a person, pull the person up and lift him or her up into the air with his or her trunk, and then pull the person into his or her mouth, and then crumple up the person, and then spit the person out, and the person is all broken up, and chewed up, with all the bones, broken, in the legs, and in the arms, and in the waiste, pelvis, torso, neck and shoulders, and head.

The Lesbianists use lots of these elephants. They are pretty to look at, but they are mean, and nasty. When strangers see them, they think, 'Oh, what a pretty elephant.' They don't know that the elephant is my abominant kid, and can speak English, as many people recently found out near Africa, in Sri Lanka, and then also in New Guinea.

They were very surprised at the talking elephant. But they didn't know that the Lesbianists had let the Elephant, my abominant kid, lose from the cages that they kept him sealed up in. There were one or two, or maybe eight of them, in Sri Lanka, and eight or nine in New Guinea. Lots of people got eaten up, and killed. The elephants are still lose in New Guinea, but in Sri Lanka, they herded them into the pens, and brought them to New Delhi, to then begin a rampage in New Delhi.

Well, the Lesbianists are doing this, daily, because they feel they have lost this battle, and that they are just wasting time, doing nothing, as they can not get to me. So they want to have a lot of fun. Now they are releasing lots of my abominant kids, in many places, and in New Delhi, Bombay, Sri Lanka, and New Guinea, many people have been hurt and killed by these idiot kids, these abominant elephant kids of mine. The Lesbianists have thousands of animals they want to release, out into the public, in England, in Switzerland, Georgia, South Carolina, Paris, and many other places.

The Lesbianists think they are going to have a lot of laughs watching the abomniant kids of mine, tear people up, and rip them to shreds. They also think that the animals, who are not abominant kids, but are just bizarre animals, that catch people in very large, nets, that have threads as thick as ropes, and that are very sticky, are going to do a lot of wierd and crazy things, no one here on this planet, other than them, have seen. They think they are going to get a lot of laughs when they see the mayhem and havoc, the disruption to society, and frustration on the faces of people who get caught in the nets, and then turned into living mummies sealed up in a type of pulpyish paper so the person can slowly disolve, but stay alive, for up to a year or more. Maybe as long as ten to thirty years, in some cases, and I'm not kidding.

You may think I'm kidding, but I'm not. This began a few days ago, and the Lesbianists are intent on continuing this, for the next few years. Isn't that surprising. I never expected that. They are very strange people, aren't they. They are real sicko's aren't they.

I think you should all go and meet my kids, with a day pass, and ask them about it. Other wise, you might find your self in a very large

spider's web.

Labiating A Labia

To labiate is to suckle the labia, and to take one or the other of the labia into the mouth, and tickle it with the tounge, or twist it gently with the lips.

'Labiate that woman's left labia!' 'Felate that womans left felate!' The difference is, labiating is to suckle the entire left labia, inside or under the edge of it, on the inner side, and the edge of it, and the outside of it.

Felateing the felate, is to suckle the edge of the labia, the upper exposed edge. It does not include the labia, in its entirety. Only the upper, protruding skywards, or in which ever direction it is pointing, that portion of it that is extending outwards. If you lift it up between your finger tips, you'll pull up on the entire structure revealing the underside, or the unexposed underside of the labia. There is also the outer side of the labia.

The Felate is the top tip edge of the labia, generally speaking, and it is itself an isolated system, and not part of the labia. It's connected to the labia, but it serves a different function. It droops downwards, to seal out the possiblity of any thing entering the vagina from below, in an upwards moving manner. Bugs can not fly up into the vagina, as the felates prevent them from flying up into it. Without the felates, the vagina would be unprotected. The labia would not protect the vagina, as the labia is merely the skin tissue mass that the felates are attached to, and in an instance of removing a felate from a cadaver, or dead body of a woman, or girl, once the felate is removed, the labia have no closure over the vagina, in most women and girls.

There are exceptions, as we've had many animals in our heritage line. There are many differences when we line up ten women, and inspect their vagina, their felates, and labia, their bumbey pack, as children are encouraged to call the lower hanging sexual organ of the vaginal cape, as it is also called by doctors.

On this planet, the bumbey pack may not be called a vaginal cape, with the inferior texts with unadvanced, primitive, witch doctor level sexual sciences that do not help any one along, such we find with the myth that women and girls have a period every twenty eight days.

That is total nonsense, as I've explained about it, before. The truth is, every few days, to every eight to fifteen days, to even eighteen days, or evern thirty two or fifty five days, depending on where the woman has grown up and where her ancestors have grown up, the number of days between one period and another period can be very dissimilar, from one woman to another woman. Some women have a period every two or three days, or even every day. There is no reason an ovary can not fall, every day, several times a day.

An ovary is so small, no one can see it, without special optical technologies, such as pass through see through technologies, and other optics, and other videoing technologies. A microscope is an out moded, ancient, and novel device, fit for only museum use on display shelfs. It's like an old car of the twenties, or there abouts, or even earlier, of course, depending on how sophisticated it gets. Micron microscopes, the so called, 'electron' microscopes, are a misnomer to begin with, as an 'electron' is not a fictious concept, but no one knows what an electron is, generally speaking except for the Lesbinists.

An electron is a small bit of electrically heated plasma, that you can heat, with the right technologies. It can fit on the tip of a pencil or pen. This is a big joke to the Lesbianists, as are also their jokes about protons, and neutrons, and nuclei, or the so called combined nucleus, as in 'nuclear' family. Nuclear family, is not a 'tight' organization of two persons, and their children.

A nuclear family is a family that has been nuclearized, that is, exposed to radiological salts kiddies, and their radiative or radiological energies. That's another one of the Lesbianists' jokes on all of the scientists who the Lesbianists could get to swallow it.

What Causes A So-Called "Nuclear' Explosion Or Detonation?

A vast number of children are making babies at a very high rate of speed, and the energies that they give off, as they make babies, and then peel off from the area where they made their babies, one after another, as they rocket away, is what causes a nuclear blast. The tummy mommies and tummy daddies are making babies at such a frantic pace, they make millions and billions, and trillions, and more, before you can even send a signal to your eye lid to blink, from your brain part that sends the signal out. The signal will travel just a very short distance across a crupture, not even half way, more like, one or two feet in distance, if we are to look at the size of a crupture as the same size as our current universe. It travels about not even one foot, not even one inch, and not even one millimeter, and not even one millionth of a millimeter, and far smaller than that still, before the parents are already through making babies, and they have retired, and passed on, and several kabillion generations of families, and multiply that by a very large number, and you'll get how many generations of families lived and died, and passed on their DNA to their sons and daughters.

It's a hail storm of erupting magnitude when the tummy mommies and tummy daddies begin making babies, and making their families larger.

It all happens so rapidly, with more than that number of successive generations of families, in less time than the energy pulse will travel down an optic nerve, across a crupture, that very minute or very tiny distance, as I stated above.

That kind of frenetic baby making activity, makes for a lot of heat, as well as, it generates a lot of stresses, and a lot of energies go flying off in all directions, as the sexaling couples experience many nice orgasms and eroticisims, together.

Temperatures, their body temperatures, collectively, and the incredibly vast number of movements, which also generate temperatures, by the animals, the tummy mommies, tummy daddies, tummy babies, the relatives, and the many generations of families, go skyrocketing, and the magnitude of numbers, and the intensity of all the activities the animals are busy with, as they make tummy babies, simultaneously, or nearly simultaneously, is of phenomenal proportions.

If we slow them down, to our pace, and then compare them to our pace of life, they would be just like us, and things would move slowly for them, and not much would change, for many kazillions plus years, and then many, many more years.

However, they are moving so much faster than we are, and the length of time they live, to them, it is a long time, four or five, or eight or nine hundred years, in our time, maybe, in some cases, depending on the type of radiological salts kiddies making babies.

On their scale or pace of life, they live that long. But on our scale, the length of time they live, is so tiny, we can not measure it, unless we have a very high level of advanced mathmatics that can account for such a small time period, or span of life.

Anyway, the frenetic adventures of the colony of radiological animals, when they start to make babies, after they are woken up, and prompted to make babies, with a detonating surge of heat energies, light wave energies, pressures energies, trampolining energies, which get them started, with the right combination, of heat, light, atmospheric temperatures, atmospheric pressures, food sources avaiability, drinking water avaiablity, trampolining energies, and a number of other types of energies, that awaken them, and then get them turned on, and sexaly active, they will suddenly erupt into a frenetic, mass of baby making furor, to us, any way, and with that, we have our so called, 'nuclear' detonation.

Cleansing Your Self With Your 'Built-In' And 'Attached', Cleansing And Washing, Clearifying And Erasing Energies Producing Genitals And Sexaling Systems, Eroteming And Orgasming Nervous Systems, And Baby Making Related Purifying Energies Generation Stations Aparati, Or Apparatuses, And Armatures

You women and girls, your vagina is your Holy instrument for assisting you to cleanse your self, and wash away the dirt and grime of daily living, the insults to you from strangers, the verbal abuse you experience in your arguments and conversations with friends and family, neighbors, relatives, work associates, and community acquaintances.

Your Holy body is a weapon to fight back against all the negativities you experience in your life, as you orgasm and erotem, showering off purifying energies, and lots of other beautiful other things and dings, as you vibrate your entire body concordially, in harmonic rythym, cadence, and rapture, with my Holy Body.

Your breasts, your butty butt, your butty butt hole, your vaginal hole, your groin, your throes, your vaginal cleavage or labial folds as they are called here by these nitwittish doctors on this planet, who do not know any thing about the human body, your chest, your back, your legs, your arms, your hands and fingers, your ankles, feet, and toes, your ears, lips, mouth, tounge, cheek, your rectal cavity, your tummy button, your stomach, throat, your brains, and you have many more than just one in your body, but many millions and more of them in your body, and that is not an overstatement, and every part of your body, inside and out, your many nervous systems and all your organs, they are all set to orgasm and erotem, and generate purifying energies with the help of the power company, as I've explained about them, before.

Ticklement Tuning Forks

You have ticklements, tuners, or pitch fork tuning forks, that chime, in every cubic millimeter to every cubic inch, and in even tinier places, you have tinier ticklements, or tuning forks, and in larger areas, you have larger ticklements, or tuning forks, and they are all set to vibrate in various patterns of sexual thrilling eroticisms, and orgasming ecstacies, as you pump up the levels of sexalating energies you have available to you, in you, and showering off from you, and those patterns and focal points change, slightly, minutely, as every micro second goes by, as we change our location in our universe, and our relative location or position to every thing else in our universe changes, from night to day, and from day to night, ongoingly, non-stopingly, never repeating the same set of tuning focal patterns. Focal patterns are frequencies.

Focal Patterns

These frequencies, or harmonic consistencies, are harmonic displays or the 'in rythm' with GOD, consistencies that allow you to be united with GOD, me, my devine and holy body, and my devine and holy mind, and being or GOD SELF and GOD BEING, every moment.

Men and boys have the same ticklements, or tuning forks, and they are located in every organ of their bodies, just as they are in women's bodies and in girls' bodies, and they allow all of you children of mine to stay in frequency with me, as you sexalate, erotem, and orgasm, practicing my religion, and as you live your daily lives.

These many ticklements and tuning forks are all connected to your brains and to your nervous systems, and each living being in your body, has them as well, and every living being has them as well.

All my children, animals, living beings, and human beings, are all connected to me, through these tuning forks, and also, through the holy bodies all my children have inside of them, and also through a myriad of other mechanisms that I have functioning in your bodies, in your astral 'energy' bodies, and the many millions of energies bodies each of you have in you. My animals children and living beings childrens have fewer connectivities and fewer energies bodies, as they do not need as many as my human being daughters and sons. This is because you, my human being children, need to be more connected to me, as you are the only ones who can actively practice my religion, with your own self determination, and desire to practice, to become closer to me, GOD, purer, and holyer.

I'm connected to all of you, day and night, three hundred sixty five days a year, in countless many fold untold numbers of ways and manners, and with countless many fold untold numbers of mechanisms. All of my children are likewise connected to me, in similar ways and manners, and with similar mechanisms.

As you women, girls, men, and boys sexually rapture, erotem, orgasm, and reach sexual peaks, and then sustain them, you grow holyer, as you become purer, brillianter, and closer in GODLYNESS to ME, GOD.

Obviously, then, the primary means for you to grow pure and holy is to sexalate, and as you continue, over the days, and weeks, then months, years, decades, hundreds of years, thousands of years, millions of years, and more, you slowly grow more pure and holy.

Sexaling is my primary and most fundamental religious practice and your primary religious practice for you to become cleansing machines, washing machines, purifying and sanitizing machines, so that you can clearify and erase your karmic markups, and purify your lives, and the lives of those around you, with your selfless actions of grace and serenity, sexaling and showering purifying energies in all directions for the sake of your self, and for the sake of others.

You women and girls need men and boys to assist you to become the powerful cleansing and purifying machines that you are capable of becoming.

Men and boys used to be somewhat nearly as useful as purifying and cleansing machines, as women and girls, but men and boys have different jobs, and different priorities, and there fore, the burden of work to purify my universe, and to clearify the karmic markups of all my children rests on the shoulders of all women and girls, with men and boys assisting women and girls.

You men and boys need women and girls to lead you, and to help you to become more proficient, powerful, and more capable cleansing, washing, purifying, and sanitizing machines.

Assistive Religious Practices

The practice of praying Nam Myeo Ho Ren Ge Kyeo is an assistive practice that allows you to become in touch with my GOD SELF, equally as well, but the time it takes, is much longer, as very little purifying energies are produced, merely by using your brain, muscles, ligaments, sinews, bones, mouths, tounges, and jaws, as energies sources.

There are many other assistive practices, from meditation, to breathing techniques, to yogic techniques, to ballet like techniques, to dance techniques, to body movements of various kinds, to help you to increase and or also store up your energies, and then for you to release them, for you to then become more firmly and closely connected to ME so that you can eventually begin to gain a higher appreciation of ME, GOD.

My many religions teach many ways to do this, and before my many religions were corrupted by the Lesbianists, they worked to varying degrees of success.

Therefore, sexaling is the primary fundamental religious practice, and all other practices in my religions that I've taught over time, spanning all of my previous teachings from the begining of our time together, since I, my GOD SELF, created you as my children, are assistive practices, of one kind or another.

Sexaling, eroteming, orgasming, phlumetting are important practices, and as you orgasm, you are purifying your self, and others by pushing out and spraying your self with purifying energies as your holy and sacred energies shoot out to cover you and emmerse you in full body coverage, from head to toe, showering and shattering energies every where around you. They then build up and cover over all others who are around you, as well, with your purifying erototistic and orgasotistic purifying energies, clearifying yours and their karmic markups.

Astral traveling is another type of practice, but we'll define it, another time. Experiencing hyper trance states of mind and being, and a nearness to GODLYNESS are also a practice, and we'll define it, when I can remember every thing I need to remember about it.

Participating in my religious ceremonies is an assistive religious practice you can enjoy, as you become purer and holyer, and after you recognize that I am your Mother and Father, and your CREATOR, and that you exist because of me, as I made you from pieces and parts of me, your CREATOR.

After you realize this, you can enjoy participation in ceremonies with me, as training priestesses and priests, and you can make your way up the purity ladder, the more you participate with me, GOD, in my religious prayer hand signaling ceremonies.

Praying Nam Myeo Ho Ren Ge Kyeo to my Holy Body, or to the Gurkian Mandala, as I've explained about, is an assistive practice that will bring results.

It will not bring results as well and as effectively and as quickly, as sexaling, which is the most holy and virtuous practice, along with eroteming, orgasming, phlumetting, astral traveling, peaking, and so on.

I've spoken about peaking, before, and women and girls can peak, and experience wonderful feelings.

In any case, do not confuse assistive practices, with the fundamental and primary practice of sexaling. We'll get back to all those other things, to define them, betterly, another time, after my brain heals, a little bit more, and after I erase more karmic markups that keep my brain karma from improving, fast enough for me.

How To Make Prayer Statements

Remember to include a prayer statement, such as 'I pray to the holy ephemeral body of the Creator, John Francis Ayres, for the [insert private prayer statement]', such as, '... for the serenity of mind, and the gratefulness of heart, for all those around me, who have helped me to become the person I am, and can become.' or, '... for the peace of mind, and serenity of heart, for the love of all men and boys, and the cooperation of all women and girls.' These prayers said by a woman or girl. Men can pray, similarly, '... for the grace and deviness of the women and girls who surround me, I am greatful to them, and I pray for their continued good health, and prosperity'.

You can also say, 'I pray to the holy body of the Creator, John Francis Ayres, for the [insert private prayer statement]', but only when I am in the middle of a religious hand signaling prayer ceremony, i.e., while I am doing a prayer ceremony, and saying my prayers with religious holy hand prayer signals that my special kids who are religious kids, can pick up and then act on, in concert with other groups of kids of mine, who also are religious kids, most of them, I think, and who work together with my primary groups of religious kids.

I have lots of kids, and some are normal kids, who go about their jobs, as expected, for earnings, just as most people we know. But I also have lots of other groups of children, who are more, religiously oriented, to varying degrees, and who are very religious as their work is all for the sake of my religious self, my GOD SELF. My religous kids catch my hand signing, and then they pass the messages along to others of my groups of children, and with all of the different groups of children I have doing 'good' works for me, as well as groups of children who do 'religious' works for me, as well as groups of children doing normal work for me, but for the sake of my religion, nevertheless.

They all coordinate themselves, somehow, I have yet to figure out how they do it, but between them all, they get the jobs done, that I ask them to do, while I am religiously - and the prayer statements I am signing are very holy - hand prayer signaling, i.e., hand signing.

So, unless you know for a fact, by seeing me on a tv, such as during a live broadcast, once I get my religious conveyance set up, and built by my children, after all the conditions are met, for securing this world from the grasps of the Lesbianists, and after killing all the Lesbianists, and / or after making the remaining Lesbianists surrender, and then after all other conditions are met, as I don't know all the conditions, I've set, as my memories are still foggy, as I'm amnesiatic, as well as mentally retarded, but in any case, if you see me on tv, on a live broadcast, doing my hand signing, you'll know I'm in the middle of one of my prayers, and then you can say, 'I pray to the holy body of the Creator, John Francis Ayres, for the [insert private prayer statement]', and you can omit the 'ephemeral' if you like, as it will work better if you omit the word 'ephemeral' as while I'm praying, I'm my normal, GOD, self, though I may not look to you, on the surface, to be any different, over the video links, or even in person. It never the less works better if you use my recommended methods of making prayer statements, this way, for you to maximize your private prayer statements.

All of my groups of kids have lots of friends, and they do lots of work for me, and I do not remember how many groups of them there are, and how many children I"ve got, as yet, but in time, I'll be able to give you a better idea of how they work together to get the work done, that I ask them to do for me, with my religious hand prayer signals, or hand signals, as in hand signing, or signing.

My kids use signing for all their work assignments, so I use hand signing that they can catch, pick up and read, and it is all pretty much very religious in nature, and it is very solemn, as I am GOD, and when I'm signing, they know I'm GOD, and do not doubt it.

When I am not signing, they might now and then, doubt that I am GOD, but never the less, I am GOD, and my signing proves it to them - when I am saying my religous hand prayer statements, by hand signing - with out any room for doubts in their minds.

In other words, I'm a typical person, just a little mentally retarded, brain smattered, or brain damaged, after my many youthful and other brain bashings I recieved, the wiring is a little scrambled up, upstairs, and after many poisonings by the Lesbianists - from makeing coffee from kerosene, diesel fuel, gasoline, and motor oil contaminated coffee beans and then from drinking that coffee, without knowing it was contaminated with petrol fluids, as often happens to people - and with ill health karma that has me on disability, and I've been through a lot, life after life, and sometimes, my children may have had a thought or two, 'I wonder, if he is going to make it, like he said he would?'

Well, to dispel all doubts, I sign, and when I'm signing, I remind them of my old self, back in the old days, when I used to sign, religiously, and they know how serious a guy I was, so they do not harbor any doubts, so long as I am hand signing.

What To Say, When You See Me Using My Dick Or Other Parts Of My Body To Purify Others, And So Forth

You can say, 'I pray to the holy body of the Creator, John Francis Ayres, for the [insert private prayer statement]', also while you see me praying, Nam Myeo Ho Ren Ge Kyeo, or also while you see me in a ceremony, using my dick and scrotum, or other parts of my Holy Body to purify others, during the middle of a prayer ceremony, and I need not be hand signing, or praying Nam Myeo Ho Ren Ge Kyeo, as I am in the middle of prayers and activities ceremony, which is just as good as a religious hand prayer signaling ceresony, any day.

My dick and scrotum package is very Holy, and it has a very useful function, and that is, it purifying others. My lips do, too, and my butt hole, does as well. They all purify others very effectively and efficiently during my religious ceremonies.

My entire body, during a religious ceremony, butt hole, mouthal hole, lips, tounge, cheeks, legs, knees, feet, toes, butt, chest, back, arms, elbows, hands, fingers, head, neck, throat, ears, nose, and so forth, is entirely the body of GOD, as I am GOD, and therefore, while I am useing my body, during my religious ceremonies, and for my religious ceremonies, and you see me on tv doing so, then after you have verified that I am in the middle of a prayer ceremony, you can say your private prayer, in the manner as I've explained, 'I pray to the holy body of the Creator, John Francis Ayres, for the [insert private prayer statement]'.

I only use my dick and scrotum package for prayer ceremonies, except when I need to pee, so if you see that I am using it, during a prayer ceremony, or if you see me using any other part of my Holy Body, during a live broadcast prayer ceremony, then you'll know right away, that I am in the middle of a prayer ceremony and it is okay to use the statement, 'I pray to the holy body of the Creator, John Francis Ayres, for the [insert private prayer statement]'.

The same is true, pretty much, for any priestess or priest, who practices with me, in my religious holy body prayer circle, their bodies become very Pure, Holy, and Devine, but only after many life periods, that is, after many, many aeons, as they do not attain the same level of purity for a while, the same level of purity as I am at by my good old self, or the same level of pureness that is of ME, GOD, since I'm GOD, and they are not.

That means, it takes priestesses and priests longer to become pure, holy, and devine. I happen to be pure, holy, and devine, but that's because I'm GOD, and it is only during my religious ceremonies that you can understand that as you make your prayer statements, and sexal, etc.

After a long, long while, priestesses and priests will also become pure, holy, and devine, as their holy bodies, energies bodies that are pure, holy, and devine, but on a lower scale than are MY energies

bodies, since I'm GOD, and I'm in charge of keeping things tied together, here in my universe.

After many aeons plus years of practice in my holy body praryer circle, the priestesses and priests become pure, holy, and devine, and then their bodies, their normal bodies, become very purifying, just as mine is, now, when I am in a prayer ceremony. I am in a prayer ceremony, daily, a few times, to a number of times, a day.

I've gone eighteen hours straight, once, and no sooner than I go to sleep, and then wakup, right away, I begin again, and I've gone many days, straight, praying, continuously, non-stop.

This is nothing, though, and is all preparatory, as in the future, when I get my health back, as I haven't been too healthy, for quite some time, I will be praying around the clock, some days, and for many days at a time, taking a break only to eat, drink, poop, pee, and clean up.

When priestesses and priests join with me, we will go for years without stopping, and with the priestesses, and with the priests, the both of them there, present, doing the prayer ceremony on my behalf, they can represent me, while I take a nap, go and shower, get some food, nourish myself, drink some fluids, read a book or news paper, or watch the news, or a movie, game show, video, or play a video game, and so forth. I won't be taking long breaks, and that is very funny sounding, but anyway, it happens that priestesses and priests will lose their attention, and then get lost, somehow, and then go and watch tv in their bed room, or whatever, and then we have to go and look for them, and they will get a few markoffs, and with enough markoffs, they will be asked to leave the religious conveyance, and they will be put on a type of vrobatiton, or under survielance, to see if they are good or not. My kids do all my survielance work, and they keep track of every one, so 'you'd better be good, you'd better be nice, you'd better look smart I'm telling you why, Santa Clause is coming, to town'.

Who Was Kris Kringle?

Did you know that Kris Kringle got its start from me? What a coincidence. I don't think he was wearing anything, though, or rather, I don't think I was wearing any thing, but you never know, as tolerances have changed over the long aeons of time, as they pass.

When priests and priestesses become that pure, holy, and devine, as pure, holy, and devine as I am, after their many aeons of religious practice in my holy body prayer circle - pure and devine on the exact same level as I am at - then they can represent me, as Mr. mini-GOD, and Mrs. mini-GOD.

You can not represent me as Kris Kringle, and whoever my wife was, back then. I think I had a lot of guys on that team, and a lot of women and girls, too, since sexaling was a part of that religion, too.

You can learn more about it, if you're interested, by getting a day pass, and checking in with my kids, and then, signing up and joining our country, and then by becomeing a citizen, as I've spoken about, before.

You can include any good prayer, that comes to mind, that you feel is needed by you, to improve your life, and to level up your life.

You are the only ones who can pray, and practice, you women, girls, men, and boys, and there fore you are connected to me in many more ways than other living beings, the animals, and the amoebes, cells, and other living beings.

There fore, you are, both genders, the ones who will clean up the mess you have made, and you will continue to keep my universe clean, as you sexal with your genitals, and with your bodies, and with all your gizmos, igniters, trigger mechanisms, love bumps, love patches, tuning forks or ticklements, and so forth, as you are sexaling beings, who I, GOD, created, and you will sexalate, erotem, orgasm, phlumett, astral travel, peak, hyper tranceate, and so forth, just as I intended you to, from now till forever.

You will become virtuous and worthyable beings, worthyable tummy mommies, and worthyable tummy daddies, with your practice of my religion, who will bring into my universe, my many children who will join with you, and assist you and me, in cleaning up our universe, and the mess you have all made of it.

Is that understood? The answer had better be, "YES SIR!".

Lesbianists' Torment Campaign Under Way

Lesbianists are clearly releaseing wierd, ghastly, horrible, and dangerous preditorial animals, giant insects, giant spiders, giant lizards, snakes, and reptiles, ghastly, preditorial sea animals and sea mammals, winged, preditorial and horrific, aggressive scavenger and killer buzzard like creatures and other winged and destructive animals, and other horrible creatures, as well as my abominant kids to kill, maime, torture, and cause major disruptions and suffering to people, around the globe, in many locations.

Apparently, the whole world is now affected, or will be affected, by this dischordance and disharmonic display of defeated lunacy.

The peace has been shattered by the Lesbianists. It was not good before, the situation in the world, with the balooneying governments of the world, doing what they wanted to do, and torturing, and canabalizing people, and feeding people to my abominant cave bears kids, and to my crocodile people kids, and mistreating people, like Bill Gates, Steve Hawkins, Steve Irwin, many women, young girls, and men.

The war in Iraq, the phoney Saddam Hussein Trials, and all the bogus manipulation of the press and media, and the suppression of what is actually the case, with our being used and abused, poisoned, and maltreated by the Lesbianists, was a rotten situation. That was normal, or normality for us. Our karma is very poor, and we have the karma to suffer this abuse, and these torments, daily, unknowingly, in most if not nearly all cases.

But, it is becomeing really bad and there is need for serious concern, and action, to correct this situation. It has gotten out of hand, completely, and there is no stopping the Lesbianists in their wanton, and coldly miserable wish and lust for chaos and disturbances to others.

Now, more clearly than ever, as the Lesbianists rampage, the Lesbianists are causing major disruptions, suffering, anguish, and there is just an awful discordance of shock, dismay, and misery, that is growing, every moment. This is as real as the sunlight shining from the sun on a hot day in summer.

I don't have a clue what people are doing, and what is happening to them, as they are captured, tortured, and caused miserable sufferings, in many places. There must be horrible agony for many people, at this moment, and as each moment passes.

Our reality as it was has suddenly been shattered and torn up, and replaced with the lunacidal, Lesbianistic, mayhem and chaos.

Reuters reports a Lesbianists' joke for the Lesbianists, sarcastically and ironicly stateing, "New Perils Push Doomsday Clock Closer to Midnight" "(Reuters) Scientists have advanced the clock 2 minutes closer to midnight."

http://us.rd.yahoo.com/my/today/new_perils_push_doomsday_clock_closer_to_midnight;_ylt=AmUXlewr5ev2kNK_SfOHDFAL1vAI/*http://news.yahoo.com/s/nm/20070117/us_nm/doomsday_clock_dc_4

This is their private joke, to make this scenario more laugable than before for them. They could not care less, as they are manipulating every thing, and that statement is completely meaningless to them, as they are in control of every thing, in their conspiritorial lunacy to rule human beings, and to trash every one.

We'll see what the coming days, weeks, months, and years bring, and maybe there will be hope for change, when people begin to take action, to correct this situation, globally, united in spirit, permanently.

These are the most evil of evil people and abominant kids, in our immediate vicinity in our universe. We must begin our cleanup campaign here, as it begins where I am, and will continue from here on out, till we have rid my universe of all of these horrible people, and all others like them, and have made them surrender, or have sent them on to my Epcot Center.

I will establish my relgion in my universe, and begin my ministry, and they are not going to stop me, as my religion will bring positive change for all of us, forever.

I must establish myself outside the bounds of this Lesbianistic society, so your efforts and concern for our future, and your selfless giving of donations to my ministry, to allow me to set up my ministry, outside the bounds of this Lesbianistic society, non-dependent on Welfare, Supplemental Security Income or SSI, Medicaid, and non-reliant on the supported and financed Housing and Urban Developement or HUD subsidized apartment that I live in.

Once I receive in the mail, the 'Gift' donations to set up my ministry outside the bounds of this society, I believe things will gradually begin to positively change for us all, and the shift to positivity will begin, and a new universe for us all, will become for the first time, ever, a potential reality with the sincere religious practice by all of my followers, all of you, who are practicing my religion, diligently, and daily, or as much as your health and your time permits.

There in, with your efforts to practice, will bloom your flowers of dignity and hope, justice and freedom, willingness for sharing, cooperating, and participating with others in our new age of enlightenment, the Gurkian Age, and your new found respect for self and others.

Captain Off The Bridge.

John Francis Ayres
GOd
And Children

It Is Now Time To Kill All Government Workers, Public Workers, Preachers, Islamic Clerics, Christian Bible Teachers, Bible Thumpers, And All Other Persons Who Support The Lesbianists And Their Lesbianistic Societies Around The World - 'Fivers' To Kill Lesbianists And All The Lesbianists' Supporters - Coma Patients - All Persons Who You Kill Will Transel To My Epcot Center - Japanese And List Keeping - Surrendering And Pledging To Serve All People In My Universe - What Does This Mean? Updated: 21-01-07 Rev.d.01.a 19:56 PST

It is now time to kill all police of every police department in every country in the world. It is now time to kill all jail and prison workers in every country in the world. It is now time to kill all zoo keepers who work in zoos and other related places around the world. It is also time to kill all pet store personel, and pet store owners. We do not need people housing and feeding potentially dangerous animals. You are further ordered to kill all pets in all pet stores, and elsewhere, even in private homes. You may then eat them, after you have cleaned out their guts and removed tummy foods and rectal feces, etc., that are decaying matter, that is harmful to your health, and after you have prepared them for eating by cooking, grilling, fire

place cooking, barbecuing, smoke house fermenting, or by other safe and sanitary, healthful cooking methods.

It is also time to kill every fire department official or worker, no matter what capacity the person works in, as a fire truck driver, as an ambulance driver, as an assistant driver, as an attendant or support crew person, as a maintenance man of the fire or the police departement, it is now time to kill them all.

Further, it is time to kill all public bus drivers, who work on any metropolitan or local area or state or interstate, or national bus company. It is time to kill all ships' captains and their crew members. It is time to kill all railroad rail line workers. It is time to kill all subway drivers and subway line workers, no matter what their job is.

Further, it is now time to kill all military personel, SWAT team personel, all government personel, and all civilian, or trained military, national guard, state or federal militia, toy soldiers, the people who dress up in old time war regalia, and outfits pretending they are old time, earlier period, confederate soldiers, or old time earlier period, union soldiers, who act out old time North the 'Union' vs. South the 'Confederates' and who participate in city and town parades, across the United States.

It is now time to kill all retired military personel who support the deranged, crazed, insepient, and corrupted Lesbianistic societies we live in, around the world. It is also now time to kill all persons who in any way support the governments of the world, including but not limited to, all school, university, kindergarden, missionary, day care center workers, nursery school teachers, teachers aids or teachers assistants, United Nations workers, United Nations teachers, substitute teachers, catholic school teachers, Irish protestant school teachers, parochial school teachers, all religious denominations around the world school teachers and their school support workers, government funded school teachers, tuition assistance by the government school teachers, all personel who work for the United Nations, all civil service agents, all DEA agents, all FBI agents, all FDA agents, all EPA agents, and workers, BLM agents who are Lesbianists as well as those BLM agents' who are Lesbianists as well as those friends of theirs, who support the Lesbianists.

It is also time to kill all other federal, state, or local, or globally tasked organizations, such as the CIA workers, INTERPOL workers, the several groups of workers within the Canadian Mounties, NIC a spy department of the U.S. Navy, the Korean C.I.A., the United States Presidential Police agents the Secret Service Agents, National Park Rangers, State Park Rangers, Forestry Service workers, Pentagon workers, National Library Of Congress workers, and all others who work in any capacity supporting any government organization, those listed above, and all others, as well as all persons who support the Lesbianists in any way at all.

It is now time to kill all judges, bailiffs, Supreme Court Justices, and the employees who work in their organizations, and all other judges, legal clerks, para legal workers, court stenographers, justices of the peace, lawyers, attorneys, state attornys, prosecuting attornys, defense attornys. It is time to kill all officials of all government organizations, and all the people who work for them and or even only support them, such as restaraunt workers who feed them lunch, coffee shop workers and owners who feed them coffee and food, bars and restaraunt personel and owners of bars and restaraunts who support and feed any and all persons connected to the governments of the world and who work for them in any capacity at all.

It is also time to kill all the money lenders who loan money to the Lesbianists, the mortgage company owners who provide the Lesbianists with house purchasing loans, and all the supermarket workers and supermarket owners, who supply food to the Lesbianists, as well as all of the druggists, the pharmacy workers, who supply medicines to the Lesbianists. It is time to kill all the taxi cab drivers who give rides to the Lesbianists, and to every person who supports the Lesbianists in any way, at all, unless those people surrender to my kids.

It is also now time to kill all civilian or civil servant or state civil servant worker who supports in any way, any Lesbianistic organization, such as the police departments, federal agencies, fire departments, libraries, schools, and so forth. It is also now time to kill all persons who maintain or provide services to any of the above listed organizations, and to all of the similar organizations in every country in the world.

This is my order to all of you, and you are all ordered, by me, GOd/ GOD, to kill all of them, unless they surrender. People also call me, 'Allah'. I'm the same person. Just do as I tell you.

You are to take my fuels' bombs with chlorine plastics' explosives formulas, and all other explosives formulas I've explained about on my bulletin board and the fuels' bombs explosives formulas including but not limited to radiological 'fracturable' rocks that provide so-called 'nuclear' explosions, all of my bombs' formulas, and all other bombs' formulas derived in part or in whole from what we have learned as I've explained on my bulletin board and to take them, and make the bombs and explosives, and to then use them, and then destroy and kill all of the Lesbianists, and all of the Lesbianists military bases, buildings, and kill every last one of them, all of them, leaving no one alive.

'Fivers' To Kill Lesbianists And All The Lesbianists' Supporters

You are to then make certain they are all dead. If they are not dead, you are to kill them with a 'fiver'. A 'fiver' is a bullet with five lines drawn or scored with a knife or sharp instrument into the tip of the bullet, to form a 'five' line pattern, so that the bullet will fracture into 'five' parts.

You are to take three 'fivers' and shoot each person who has not stopped breathing, and who is not dead yet, and shoot the three fivers into the head of the person, to make certain the person dies.

Three 'fiver's will destroy enough brain material, to kill any person if the bullet is large enough, and the handgun, rifle, or weapon is powerful enough.

The handgun bullet size must be at least larger than a .22 calibur, and at a minimum, 7 millimeters. You may use .38 calibur, 9 millimeter, 10 millimeter, .45 calibur, or any other, large sized bullet to make certain they are dead. Buckshot, 8 guage to 10 guage, or any comparable rifle load or handgun load, or home made weapon load, will work equally as well, with three shots into the skull. A machete or similar instrument should then be used to chop the head off of the person at the neck line. If you have a machete or hatchet, or axe, and if you prefer to chop off the head of the person, then by all means, you are to do so. The point here is to kill the person one hundred (100) percent, and not leave the person in a coma.

Coma Patients

A person in a coma is perfectly alive, and can hear every word you are saying, but can not respond. People in a coma after severe accidents, such as near fatal traffic accidents, where their limbs were broken into pieces, or war victims, who are on life support in Veterans' Hospitals, can be in agonizing pain, and no pain medications are given to the patient as the patient has no way of communicating with the doctors, nurses, or staff members to complain about the pain, in many or in most cases, if not nearly all cases. Some patients can write or scribble out a note about the severe pains, or make gestures with their hands, pointing at painful spots they are able to point to, and then making squeezing motions, to indicate as best as they can, that there is something wrong in the area. Some people may catch the meaning of the gestures, but others do not, and may just wonder what is going on with the patient and they may wonder what the patient means by the hand gestures. Others, doctors and nurses, and staff members will merely find it amusing that the patient is making the gestures. Some doctors and nurses, and possibly staff members, will figure out the patient is in pain, and then steps can be taken to alleviate the pain, but it is an ordeal for the patient, and it may take months, or in some cases, years, before staff, cleaning persons, food servers, orderlies or assistants, nurses, or doctors figure out what the hand gestures mean.

The coma patient, after healing from the injuries, may still have residual pains, such as residual spinal pains, or neck pains, or ligament pains where ligaments were twisted, or ruptured, or severed, partially or wholly, and the ligaments didn't grow back properly, or didn't grow back fully, or much, or perhaps, in some cases, not at all, which does happen a lot, and each time the patient is moved in her or his bed, the person experiences extreme pain as no medications for pain are given to the coma patient, unless the patient has been

successful in communicating that there is pain felt by her or him, in her or his body.

Leaving coma patients on life support systems is the cruelest thing you can do to a person in a coma as there is no such thing as being 'brain dead'.

It is a cruel and abominable Lesbianists' joke on humanity, and on all persons, that the Lesbianists have perpetrated with their teaching doctors and nurses that coma patients are brain dead, and do not feel, hear, taste, or sense, anything at all, and it is just another one of the Lesbianists' ways to hurt and torture people, and cruelly and ruthlessly abuse human beings, in this case, in most of these cases, by proxy. There are doctors who are Lesbianists, and I have one who is one, that I am aware of, and he knows exactly what causes my health problems, but he sits there, non-responsive, and with a vacant stare on his face as if he doesn't hear, see, or know of any thing that is going on, something like the three monkeys with hands clasped over their, ears, eyes, and mouth, who represent 'hear no evil, see no evil, speak no evil' and then 'therefore, every thing is alright'.

All persons with brains, whether in a coma, or other sleep like state or condition, is perfectly brain alive as the brains and nervous systems, auditory, taste, touch and sense nerve systems, never die, until the patient stops breathing, and passes on.

All nurses and doctors are to remove all life support systems from all persons in a coma, immediately and confirm the persons have died. That will allow them to transel into my Epcot Center, and then be born again, as a tummy baby to a tummy mommy and to tummy daddies.

All persons in a coma, whether in a hospital, or in a nursing home, or at a private home or apartment, or in a group home, or group care center, are to be told the truth of this, and are to be told that you just leared it, and are to be told that I am GOD, and that I have an Epcot Center staff waiting for them to come in, to be treated for their traumatic condition, of not being able to do any thing about their condition to end it, as it is a miserable situation for these people who are in a coma, or in any trance like state or condition that resembles a coma, or a sleeping person, who can not wake up. The person is perfectly brain active, and there are no measuring devices to prove it available to hospital staff or to doctors, as none are made, and the technologies to detect a person's brain activeness and aliveness are kept secret after they are bought up, and then after the records of them are destroyed, and the information on them are kept secret and locked away, in vaults, and in storage facilities, hidden from view so that no one can get the information, and build a device to detect a person's brain alertness status.

After they are told the truth, and that you just became aware of it, you are to tell them to not be afraid, and that all measures to relieve them from their present condition, and all measures to assist

them to transel to my Epcot Center, where they can recieve personal care, and then helped to recover from the trauma of the coma, or coma like state of not being able to wake up, speak, and talk to people. They are then to be injected with a powerful sleep sedaditive, or induced to swallow several strong sleeping pills, as they may become afraid, and then, you are to help them to pass on, and to transel over to my Epcot Center.

In some cases, if you pull on the large toe of a person, or on the thumb, the person may have control to pull in the opposite direction. That is an indication that they are awake, and fully aware of what is going on around them. Please check patients to see that they have soundly fallen asleep, and snoring or breathing quietly, in relaxed manner, may be the only sign that the person is asleep.

Any sign of movement, mentally driven by the patient, no matter how slight, is nearly most always, nearly one hundred percent of the time, a sign that the person is completely brain alive, and that the person is completely aware of what is going on around her or him and can hear every thing. Even passing or expelling gas or farting, can be 'mentally' driven, and a sign the person is awake, and alert, and brain alive. Opening one's mouth is almost always, one hundred percent of the time, mentally driven.

Persons's in a coma, who have Eplilepsy, or other similar brain or neuro muscular disorder, and other conditions where patients experience spasming, whether the condition is diagnosed or not, these patients who spasm, may make some spamodic movement, now and then, and that is only a sign that the person is haveing a neuro muscular muscle spasm. Knee jerks or other similar movements, are not always muscle spasms and can be labored, mentally driven actions. These actions show the patient has control to that extent over her or his muscles, body, skeletal system, and other body systems related to the movement.

In any case, after the patient has fallen asleep, you are then to kill the person, and let the person transel to my Epcot Center, so that the person can recover in my Epcot Center, and then be born as a tummy baby, to a tummy mommy, and to tummy daddies.

All Persons Who You Kill Will Transel To My Epcot Center

Once you are certain all of the police, fire, teachers, and all others who support the Lesbianists' societies around the world are dead, they will transel to my Epcot Center.

It is now the time to bring an end to the lives of these people who support the crazed, insepient, bogus Lesbianists, and to destroy them all, leaving no survivors. Kill all of their family and relatives, and leave no one alive. Kill them all.

My Epcot Center will not be in any way, inconveinced by your brave and heroic actions. All doctors must be killed, all nurses must be killed. All medical techinicians must be killed. All library workers must be

killed. All school teachers must be killed. All art museum and gallery museum workers must be killed. All workers for all of these institutions must be killed. All of them, in every country of the world, unless they surrender and plead for mercy, and then are allowed in to my kids' place, for swearing in and for joining as civilians, my country.

Further, it is time to kill all media corporations personel, such as news casters, news men, news women, anchor persons, cameral men and women, talk show hosts, administrative persons, Hollywood's movie actors and actoresses, all radio broadcasters, and all personel of all radio companies. It is time to kill all news paper company owners, and publishers, editors, and all workers of these companies, unless they surrender to my children and plead for mercy.

It is time for all of you to kill all of them, and make sure not one of them is left living, including and most importantly, all politicians, who must all be killed, without any further delay. It is time to kill them all.

It is now time to kill Oprah Winfrey, Geraldo Rivera, Sarah Jessica Parker, Judge Judy, Jerry Springer, Liz Taylor, Michael Jackson, Clint Eastwood, Cher Bonno, Morgan Freeman, Steven Spielberg, Al Gore and his family, Hillary Clinton and her family, all of them, Jeb Bush and his family, all of them, Nancy Reagan and her family, all of them, former president of the United States President George Bush, Sr. and his family, all of them, including all persons related to him in any way, and all persons who work for him, in any way, and all persons who work for any of his associates, in any way, unless they surrender to my kids, and then plead for mercy.

We are not going to allow the Lesbianists to continue their illegal, inhumane, and horriblesome practices and activities on my planet, and in my universe, a moment longer. They must all die, now.

Is that understood?

I hope the answer is, "YES SIR! Mr. John Francis Ayres, GOd", as a 'negative' reply to my question is not acceptable.

Japanese And List Keeping

I haven't confirmed it, but from what I know, so far, the Japanese are very good at keeping lists, and they know about all the foreign people in Japan, and they keep lists of names of all of them, and they keep lists of names on all of the Korean people, and the Singaporean people, the Chinese people, the Ainu people, and the cast outs or 'burakumin' a group of meat cutters and fish sellers who some how got on a list of people who were felt to be 'unclean'. The 'burakumin' was a group of people who no one in Japan wished to talk about. The Japanese also, apparently, had lists on groups of people, who they didn't know much about, but they knew they were always doing things with each other. Those groups of people were the Lesbianists, so the

Japanese knew all along, who I was talking about and were nearly one hundred percent certain those groups were the Lesbianists living in Japan.

They read what I wrote, and the notes of mine were passed to many people on an e-mail mailing list, and when they heard that Steve Irwin had been killed, they felt they had heard enough and they told all their friends about my notes, and then the Japanese killed all the Lesbianists in Japan on that list they kept.

It's something I heard, and I haven't confirmed it, but I think the Japanese are fully capable of handling that, as they were fully prepared to deal with each one of the Lesbianists, and they knew who they were, and once the Japanese united, and decided to take action. The Japanese escorted all the Lesbianists to a meeting place, to which the Lesbianists were not happy to go to, but had no choice but to agree to follow the Japanese citizens who escorted them there, with the military or Japanese Self Defense Force, the Coast Guard, and National Police, and all other police agencies in Japan, plus the national organization of fire department workers, backing and supporting all the Japanese citizens.

As to what they did with the bodies of the Lesbianists, I'll leave that to them to explain to you, as it was quite brilliant and they had many very good ideas for dealing with the bodies of the deceased Lesbianists, who are apparently now in my Epcot Center.

The Japanese country side is now peaceful and quite, and things the winds are blowing, peacefully, and gracefully over the Japanese country side, cities and towns, across the ponds, marshes, lillies and lotus flowers swamp lands, bogs, bays, estuaries, lakes, streams, rice paddies, fields, mountains, and islands, from what I can understand and gather about the situation in Japan.

Surrendering And Pledging To Serve All People In My Universe

If the Lesbianists and their supporters surrender to my children, and then promise to devote their lives for the sake of others, serving man kind, and all human beings, and all people on this planet, and in my universe, for the rest of their lives, they will be allowed to surrender to my children, and my children will then arrest them and put them in a prison cell. If they are not willing to serve others, despite the fact that they say they will serve others and devote their lives for the sake of others, serving all people in my universe, then my children will ignore them, and my children will not arrest them because my children know they are lying. They must promise to do all they can that is humanely possible, for the sake of others, and devote themselves to the prosperity of others, for eternity. If they are not willing to do that, then please, just send them on to my Epcot Center, and we'll straighten them out, for there. My staff at the Epcot Center has training programs to straighten them out and make them nicer people, so that next time they are born as tummy babies, they will

behave and be nice to others, doing nice things for other people, after they are retrained, a little. The retraining program takes a while, but the results are very good to excellent.

If my kids decide that the person who is surrendering, is telling the truth, my kids will use the special teletransportation technology, something like what we see in Star Trek on tv, with Captain Kirk saying, 'Beam me up, Scotty!', as many of us have seen on daytime tv, or in the movie theater, and my kids have very good teletranportation technology or 'beam me up, Scotty' technology, and the person, once he or she pledges honestly to serve others, will instantly dissappear.

Do not be surprised if when the person surrenders and promises to 'serve others', promising to devote her or his life for the sake of others, the person suddenly dissappears, and instantly, the person is no where to be seen. The person was 'beamed' into a prison cell that my kids have constructed, using other technologies, and we have many prison cells waiting for the Lesbianists and for the Lesbianists' supporters, and for other bad kids in my universe, as well.

For each person you kill, my kids will keep earning points scores on your efforts to send them to my Epcot Center, and you will be paid, when you have finished your job, and then finally, go in to visit my kids. My kids will pay you in the monetary currency that is used in the underground cities my kids have built, for protecting people from these horrible Lesbianists and for protecting people from the abominant kids of mine, and the ghastly and naughty animals and very large bugs and spider like creatures, that the Lesbianists use to help them torture people with, to make the Lesbianists laugh, and to amuse themselves, as I've explained a little about, already. The more Lesbianists and Lesbianists' supporters you send to my Epcot Center, the more earning points you will score, and the more money you will earn, and you will be paid that money, when you go to visit my kids after you have finished your work, killing the Lesbiansts and the Lesbianists' supporters.

If the Lesbianists and the Lesbianists' supporters do not disappear after they surrender, and after they promise to serve others, and pledge to devote their lives for the sake of others, the Lesbianists and the Lesbianists' supporters are lying, and you can then kill them, and send them on to my Epcot Center.

My children will escort the deceased Lesbianists and Lesbianists supporters, once you kill them, into one or an other of my Epcot Centers, and will make sure that the Lesbianists and the Lesbianists' supporters get in for a meeting with one or another of my managers, or with one of the staff members who work with my managers to arrange retraining programs for rehabilitating the Lesbianists and the Lesbianists' supporters.

The Lesbianists and Lesbianists' supporters will not qualify as tummy babies, until they are finished their retraining and rehabilitating

programs. After they finish, they will be out, again, to join the rest of you, once again, but this time, as nice, kind, courteous, and polite people.

What Does This Mean?

It means, I want all the Lesbianists dead, but if they will surrender, and if they promise to serve all human kind, all people, and work and strive to enrich the lives of all others, dedicating their lives to others, then, you do not have to kill them, and you do not have to send them to my Epcot Center. If they are honest when they surrender, and when they promise to serve all people, devoting their lives to all people of the world, then my kids will 'beam' them in, using the teletransportation technologies that my children use. If they are lying, then my children will not beam them in, and they will be stuck where they are. If they are stuck where they are, after they surrender to my kids, and after they promise to dedicate their lives to the welfare of all others in the world, and to all others in my universe, then they were lying, and you may then kill them, and send them on their way to my Epcot Center, for retraining, and for rehabilitation.

It also means to kill any person who works for the Lesbianists, if he or she is supporting the Lesbianists to try to stop you from killing the Lesbianists. Also, it means that you should kill any person who tries to interfere with you, while you are trying to kill the Lesbianists.That's what it means.

And Children

Fermenting Oils - Fracuses Kiddies - Slugs, Snails, And Other Bottom Feeders - Feeding Everybody In Our Bodies - Putting An End To The Global Menace Of The Lesbianists - Changing Our Societies, And Our Universe, Forever Updated: 22-01-07 Rev.x.00.a 07:45 PST

Mix raw sugar, ocean salt, sessame seeds, dried fermented berries you have taken from a mix of berries fermenting as a flural hydrate liqour, or as a plain fermenting liqour, and make sure you dry them out in the oven, before useing them.

Mix the items together in a container, and mix in a drop or two of apple juice, pear juice, papaya juice, kiwi juice, banana juice, cherry juice, cranberry juice, strawberry juice, peach juice, nectarine juice, or plumb juice, and let the moisture settle into the mixture to allow it to become only partially and only very slightly moiste, and not wet or liquidy.

Allow the mixture to sit in a warm or cool place for a week or two, to eight to fifteen weeks, or even a few years, and it will grow molds in it, and with the longer the duration up to a point of sitting and

molding, the more useful it will become.

It might develop a pungent, unpleasant odor, like a dead animal smells, which may mean that a fungus that is not very suited for you to use as a starter mold for starting a fermented oil batch has developed in the container, and in that case, you can throw the whole mix out, or use it for fermenting beans or something. Cheeses can be made with these kinds of growing funguses and molds, if you are the daring type, who likes to experiment with new and different tastes from variously fermented mixtures.

You can add some ocean salt, and make a soury vinegar, and then try to rescue it with the combination of the soury vinegar, ocean salt, and a little raw sugar, and some honey.

It may be that some bacteria is in the mix, and it needs to be eaten up, before you can use it safely for a healthy mold mix for starting a nice cheese molds and funguses mixture.

Ocean salt can be added in slightly large amounts with raw sugar. Once the odors have stabilized, and once they have developed a more pleasanty odor of a fermenting mixture, with a slight alchohol ferment odor that will indicate that it is alright to use, and that it will not be harmful to you.

In some cases, the bacteria in the base mix, may be a result of hairs or particles of skin from the body of a dead rat or mouse, that some how found his or her way into the sessame seeds, or into the dried spices, or into dried berries that you used, and then died.

In that case, you might as well throw it away, unless you have a lot of patience, and do not mind waiting and working with it, for several years, for it to become something you can use.

One way to make it into something you can use is to mix in a high potency liqour brew, and let it sit for a number or years, and ferment it, and then after it smells nice and rosy smelling, after ten to fifteen years, to thirty to fifty years, you can evaporate the liquids out in a pail on an open porch that has a net covering to keep animals and animals' hairs out of it. Make sure there is good ventilation, and it should evaporate out, safely after a number of days on the porch in the sun. If there is no heat to make it hot enough to combust, and if there is good ventilation, it will not combust, and it will evaporate out, safely. Adding ocean salt and raw sugar to the mixture so as to fill it up with raw sugar and acidic ocean salts, will further help to safely evaporate out the liquids and prevent the liquids from combusting, accidentally.

Once the liquids have evaporated out, safely, you can use the materials that remain in the pail or container, to start a fermented oils brew mixture, or to start a cheese molds and funguses mixture, if you wish to make a nice cheese molds and funguses mixture.

The particles of skin or hair from the dead rat or mouse, or pidgeon, or other animal, will have been eaten up by all the ferment fracuses kiddies, and will no longer pose a threat to your health.

Fracuses Kiddies

Ferment fracuses kiddies are just plain old ferment kiddies who like to devour large bits of human or animal tissues, mites, or cockroaches, or their body parts, and then poop them out, and pee them out into the liqour brew.

You'll always have some of these kiddies in your brew mixes, and they are useful to you, as they eat up the things that you do not want in your tummy. Also, there are other kiddies, such as snails, and other bottom feeders, that find their way in, in the skins and pulp material as tiny animals, or the eggs of animals, and they hatch, and they develop, and they grow big, and they then bottom feed, and they eat any dead rats, and dead rat parts from rats that might have fallen into the brew. These are useful pets, that you want in your rum and liqour brews, as they will keep the liqour brew healthy to drink, and they will keep you from getting ill.

Slugs, Snails, And Other Bottom Feeders

In the old days of bucanneering, as I may have mentioned, before, this was a crucial part of keeping the sailors alive, on their long voyages, and if crew members fell ill due to an unhealthy brew, with a dead rat in the mix, making it sour, and making it unhealthy to drink, then if there are not enough snails, slugs, and bottom feeders in the barrel or rum to eat the dead rat parts, the sailors will get ill, and when they get back to port, they will hang the rummery owner, and give the business over to the son, or to a third party, often times, one of their fellow crew members, who is liked by all the people, locally, and on the ship.

This is the case, still today, with many rummeries owned and handed down in the same family, from such instances as that.

Bottom feeders, slugs, snails, and many types of bottom feeding earth worms, and other types of healthy bottom feeding worms, that cohabitate well with the slugs, and snails, and other animals that are too tiny for you to see in the rum brew mixture, without a powerful microscope like, optical videoing technology, are essential to your brews mixtures, and they may increase in numbers as they make babies like every animal and living being does, and so now and then, you need to reach into your brew container, with your hand, or with a fine mesh small aquarium use fish net, and scoop them out, and flush them down the toilet, or let them loose in a local pond, lake, mountain stream, or water springs fresh water well, where they will help to keep the water clean, ahd healthy.

Once you have the materials to make your fermented oils mixture, you can add them to your container of food oils, and begin to ferment them, or use them to make a nice cheese mixture, to ferment and then

to make solid as it matures with age. You can also use the materials to make a fermented bean mixture, or fermented barley, or fermented rice, or fermented millet, or fermented wheat mixture.

You can also use them to make a fermented brew mixture, as there will be many healthy molds and funguses kiddies in and among the dried out materials. Your health will improve, and by adding different spices, nuts, berries, root particles, ground up kiln dried pine cones that were green to begin with, and then fermented for a few months to a few years, in a brew mixture, then dried out, and ground up into a saw dust powder consistency, you can then have lots of crystals cages salts kiddies of various kinds help you to make a nice regroverative brew, to help you to regroverate your amoebes.

Feeding Everybody In Our Bodies

You know, we need to eat foods to stay alive. We also need to feed all the living animals in our body, to help them to stay alive, so that they can help our health remain normal, from day to day. We also need to feed the amoebes all the foods and juices, salts kiddies, and the poopy liquids and pee liquids, and other liquids with other types of tinier salts kiddies in them, as well as other types of food kiddies, we haven't learned about, yet, but with all of them inside your tummy, you'll be able to feed every one who needs feeding, and then you'll be successful with your amoebe 'auto regroverate mode, on!' formula, so long as you have degunked your body of all the petro chemical oils, kerosene, diesel fuels, and other chemicals, the Lesbianists have been feeding you, from birth, in your diets, if you live in a society, where you are fed baby formula mixtures from Gerbers or Heinze, or any of the other baby foods manufacturers.

Putting An End To The Global Menace Of The Lesbianists

We need to put an end to this practice by the Lesbianists of poisoning us with their petro chemical industry oils and tars salts kiddies, which they use to rot our teeth out, and cause tooth decay, and which they use to cause ulcers in people's tummies, and which they use to cause lots of unpleasant illnesses, and diseases in human beings, and in farm animals. These petro chemical salt kiddies, and formaldehyic salts kiddies, all harm our amobes living beings children, and all the other animals that live inside of us. One day, we will have a lot of people practicing my religion, sexaling, and making prayer statements so as to help us to erase the karmic markups we have, that keep us living under the tyranny of these Lesbianists, and in their societies, suffereing the daily poisonings that cut our lives short. When we have erased enough of our karmic markups with my religion's religious practice of sexaling to purify our selfs and others around us, and to clearify and erase our karmic markups, we will eventually be able to say good bye to the Lesbianists, and their practices of poisoning us, and causing us major headaches, or problems in our lives.

Changing Our Societies, And Our Universe, Forever

At that time, we will be able to say hello to a whole new way of life, and that will be the beginning of our new, thrilling, and excitingly challenging, one world, unified, planetary, global culture, and it will be the begining of our new, thrilling, and excitingly challenging, one universe, universal culture for all of the people in our universe, who we have been living in our universe together with, since we first came out, and began living here in my universe, a very long time ago. We have to start somewhere, and so here we are, now, begining to prepare the foundation for our long and prosperous journey ahead of us, as we clean up our universe, together with each other, and clearify and erase all of our karmic markups, and all of the karmic markups of all my children, and of all living beings who live with us, together with us, in my and our universe. We need to take responsibility for this clean up campaign of ours, as we are the only ones, besides my many worker, unionized children, who can use our brains, and use our sexaling organs, to produce purifying energies of all types, to help us clearify and erase all of our karmic markups, and all karmic markups, and karmic things and dings, of all of my animal children, and of all of my living beings children, and of all of my human children.

My kids have built underground cities, to help us to get started, in learning about the new ways of living together, and of sexaling together, for practicing my religion together with each other, so that we will be able to prepare ourselves, for our new global, unified society, and for our new, universal, united, civilization. We have a long ways to go, but we are starting now, with your efforts to correct this situation by eraseing the karmic markups and karmic things and dings, that have us living in this truly awful situation on this planet, in our universe, that we are now, curently living in. One day, when all the Lesbianists are either dead, or have surrendered to my kids, we will be able to gradually educate ourselves, and change our understanding about women and girls, and about men and boys, to understand the truth about women and girls, and about men and boys, and then we will begin our new and exciting journey into our future, together, with my religion at the basis of our new, unified society, universal culture, and universal civilization.

Donations To GOd - Monastic Mode - Who Works For Me, Anyway? - Obeying Orders - Every Politician In The World To Be Executed - Every Hollywood Actor And Actoress To Be Executed - Jump Ship, Explained - Fair Warning - Particle Remis Technology And Particle Dismiss Technology - Dismend Technology And Remend Technology - Mentalcosis / Mentaltosis And Comatosis - Michael Jackson - Retractions Updated: 26-01-07 Rev.b.02.a 06:45 PST

Donations To GOd

Why can't anyone donate any thing to me? I am GOd. So, how come no one can send me a penny in the mail, or a box of cookies, or a pair of socks, or something? I don't think I'm asking for too much, but I'm just curious about why no one can send me anything in the mail?

I don't get any phone calls. No one sends me any e-mail. No one tries to visit me. I have a religion, and I'm asking people to practice it. Now, how come no one can contact me?

I once said that I am in a monastic mode, and it is a cloistered monastic mode. That means, no one can be contacted out side of my monastery by any one inside the monastery, and no one can contact any one inside the monastery, by any one outside the monastery.

If there is no legitimate monastery business then no person will be allowed to contact me, or for that matter, any one else inside my monastery, who is leading a monastic life, with me.

Well, there is only me, right now, but maybe in the future, some one will be in my cloistered monastic discipline with me, helping me with my religious duties of doing my religious ceremonies, as I've mentioned about, before.

Monastic Mode

What does my 'monastic mode' mean? It means that I am here as GOD. You know, there is only me. I of course never sent any one, such as the Lesbianists claim. Why would I? I don't need any one to do the things I need to do. That's sheer idiocy to think I would have a son or daughter, and send them to do my business. That's absurd. You've been snookered into believeing all those hogwash tales, and now you don't know who I am, and you don't have the karma to believe in me, as a result of your following and believeing all those hogwash tales. My kids are everywhere, and they are doing their jobs.

Who Works For Me, Anyway?

Now, as I've been saying, I'm going to have you do your jobs, and that is to use your genitals, and to use your body, and to use your brains, and then participate in my religion, using your genitals and your body and your brain, and sexalate with each other, and purify your karma? Does that sound like a joke to you? If it does, you are very mistaken because it is not a joke in any way, and I am absolutely serious when I say that you are going to use your 'equipment' and I almost want to call it, your 'field' equipment, because you are armed with it, day and night, and you are going to use that equipment, to clearify and erase your karmic markups, and to purify my universe. Is that okay with you? I hope it sure the hell is, as a "NO SIR!" at this point, would be an unsatisfactory reply. Do you understand me? I hope so. You are going to jump ship, as I order you to, or be thrown over board, if you have a problem with that. I hope you understand.

Well, as far as I can figure it, no one realizes that I am GOD, so no one can donate money to me. If some one realizes that I am GOD, than

for the first time, that person will be allowed to donate money to me. That person will be allowed to visit me, or call me on the phone, or donate money or food to me, or practice my religious ceremonies with me, if that person believes, and understands, and realizes, that I am GOD.

Right now, there is no one who realizes or understands that I am GOD. No one of course believes I am GOD. Never the less, I am GOD, and I am sitting here, waiting for donations, to help my ministry get started.

So, that is the reason that no one can get through to me, or donate money to me, or send me a postcard with some kind of message of cheer and support in it.

There doesn't seem to be any body who believes that I am GOD. Well, that isn't surprising. People do not have the karma to believe that I exist, is one way of looking at it. They have ignored my existence, and have not had any real thoughts about me that would link them to me, in my monastic mode.

What does that mean? It means, that no one remembers me, as the guy who created all of you.

It also means, that I am in a religious mode, and no one understands that, or believes that I am in a religious mode.

That is peculiar, since I am giving you a religion, one of my oldest, for you to practice, that will assist you in purifying your life, and that will assist you in eraseing and clearifying your karmic markups.

That's very peculiar, but it is not that peculiar, as you do not have the karma to realize and understand that I am GOD.

In any case, there will be no donations, no telegrams, and no phone calls or letters to me, so long as you do not realize, understand, and then of course, believe that I am GOD.

Well, any way, so it goes.

Obeying Orders

Now, I want all these people, killed. Hillary Clinton. Bill Clinton. Chelsea Clinton. Ted Kennedy. Al Gore. Tipper Gore. Harriet Gore. Cheryl Gore. Dave Gore. Bill Gore, and all people who call them selfs, Gore and pretend to be related to Al Gore, or to Tipper Gore. Mr. Al Gore has lots of friends, who are also Lesbianists, and I want them all killed. Oliver North. Monica Lewinsky. Eve Arden. Elizabeth Arden. Michael Jackson. George Bush Sr. and all other George Bushes. Do you understand what I mean? It means, that they are all Lesbianists and they are all going to die, and we are going to blow up Washington D.C., and destroy Capital Hill, and level that area, and make it sink beneath the waves of the Atlantic Ocean. That's how big a bomb I want you to make, with my fracturable rocks, to then blow that area out of the water, and make it sink below the waves of the Atlantic Ocean.

You'll probably need more than one bomb.

Did you know that Washington, D.C. is lying on a fault line, deep down, and it is on an ocean shelf, that has the ocean under it, lapping at the earth, very far down. That means, that it is on a fault line, and it is on a shelf, that is hanging over the ocean's waters.

Now, if you hit Baltimore, and Maryland, and Northern Virginia, and Washington DC with a large enough bomb to blow Baltimore out of the ground, and level it, and with another bomb large enough to blow Washington DC out of the ground and level it, at the same time, and a few more bombs, large enough to blow Maryland, Virginia, and that whole metro area out of the earth, at the same time, you will sink the nation's capital, that is, Washington DC, below the ground, as it will break off the ledge that it sits on, and it will sink into the ocean, as the ledge crumbles below it. There will be water, from the Atlantic ocean, all the way out to West Virginia.

Now. I have every right to say that, and demand this, as it is a matter of self defense, as I know these motherfuckers are eating people, cannibalizing my kids, for their amusement, thrills, and fun, and they will continue to do that UNLESS THEY ARE STOPPPED! Do you understand that?

I hope so. I am going to see the whole of Washington DC and the area leveled, with Baltimore, and Northern Virginia, and Maryland, as well, and we are going to sink that area into the ocean, and make it disappear below the surface of the waters of the Atlantic. Now, that should be clear, shouldn't it.

This is not a joke. We will have to send a lot of my children to my Epcot Center, in the blasts that will occur, and in the after math of the blasts, but that is unavoidable.

We will have many people, drowning in the waters that come in from the ocean, and that stretch out to the hills of West Virginia, with only slight outcrops of land, hills, here and there, with a few people lying on top of them, blinded and in awful pain, but they will not live long, as they will not be able to survive for long, and they will pass on, die, and then they will transel to my Epcot Center, where they can get medical relief, medical treatment, therapy counseling, and rehabilitative therapies.

Now, that is what we will do to Washington DC and vicinity, so every one, please prepare for it, and get your pain medication in order, so you can take an over dose of pain pills, when your area is blown and shredded to bits, with one or more of my fracturable rocks bombs, as I've explained about.

Every Politician In The World To Be Executed

Next, I want every politician in the world, canceled out. I want their passports for living on our planet, canceled. That means, I want you

to kill each and every one of them. Not only do I want you to kill them, all, but I want you to kill every single one of their associates, around the world. They are all Lesbianists, except for a few of them. If you happen to kill one of the non Lesbianists policitians by mistake, that is okay. They have the option of surrendering to my children, available to them, and once they surrender, they will not be killed, by accident.

Every Hollywood Actor And Actoress To Be Executed

After that, I want every Hollywood actor or actoress killed, and that includes all the actors and actoresses, around the world, and they must surrender to my kids, if they wish to not get killed. There are a lot of them, who are not Lesbianists, so those I've mentioned, who I've let you know are not Lesbianists, you can forget about them, and leave them alone.

There are more than a couple of billion Lesbianists living under the earth's surface, in underground cities. I did not realize there were so many. We need to kill them all, so we will, in time, unless they surrender.

Is that clear, every body? I hope the answer is, "Yes, Sir!" as you had better not answer any other way, or you will get yourself on my shit list. Is that understood? Good. I am the boss of my universe, so if you do not like it, than jump overboard, now, sailor. Have you got that clear? Good.

Jump Ship, Explained

What does 'jump overboard' mean? It means you are going to have severe problems with me, if you do not obey orders, and that there will be difficulty and jail time, ahead of you, if you continue to ignore my commands to you. It means there is going to be trouble, if you do not obey me. My kids are in charge of handling all the details on that, and it is not a joke.

Fair Warning

We are not going to let these Lesbianists run their show, one more minute. We are going to put an end to them, and their activities, here on this planet, and every where else in my universe, and this is fair warning of that.

Particle Remis Technology And Particle Dismiss Technology

As I said, once before, there is a technology called particle remis technology. There is also a technology called particle dismiss. They are the technologies that you can use to feed 2.3 billion Lesbianists down under the surface of this planet, and on every other planet that they are on.

Dismend Technology And Remend Technology

It is easy to dismiss molecules, and to dismiss, or dismend all the beings who need to be dismended, and sent to my Epcot Centers. It is also easy to remend them, and then get them back into the foods that I need them to be a part of.

My kids keep track of every one who needs to be dismended, and then remended. That is a lot of work, keeping track of every one, but that allows us to dismend the living beings, and animals, that I can let off from duty, and from further service, and then send to my Epcot Centers for them to live in. I can then recall them to duty, and remend them, and then have them serve in an apple or an orange, or banana, or a brick. Do you think that is a joke? It is not a joke, and there is no joking allowed, on my shift. Do you got that? I hope so, because if you do not, you will have to learn how to swim a long ways, as it is going to be a long way from shore, after I ask you to jump over board, and I have sailors who practice, all the time, just to show the passengers how it is done, just in case. I will have you jump from ship, if you do not get along with me, and if you disagree with what I am doing, pretty soon, as we are departing, now, or just about now. That means, we are not going to play around, much longer, and we are going to set sail. That means, there are going to be a lot of people practicing my religion, pretty soon, as they will learn about it, and they will begin practicing it.

Mentalcosis / Mentaltosis And Comatosis

Mentaltosis is the state of a vegetable, like a stalk of cellery, or a plumb, or an orange. Comatosis is the state of complete awareness of self and others. Comatosis is not brain dead, i.e., more or less, mentaltosis, with no real significant brain activities occuring, other than the ones that keep you alive, and vegetative, and you do not need assistance to remain and function in a state of mentaltosis, and the Lesbianists know it. You are severely brainally handicapped, and when you come out of it, eventually, after you have your karma fully completed for being mentaltosically ill, and after it is then time to get on to something else, you will be very brainally handicapped, and you'll be an extremely retarded person, with little to nearly no brain awareness going on about self and others, but able to walk, barely, and later, after many many lifetimes as a mentally retarded individual, you'll begin to be able to mumble a little, or babble a little, for umpteen lifetimes, as you begin to get your higher brain functions, back, which takes a very long time to work out, and many many lifetimes to work out, karmically.

Comatosis is like a hit on the head, and when you wake up, your faculties are not all working, and you may not be able to speak, or move, or talk to your friends, but mentally, you are all there.

Mentaltosis is like a train ran over your brain, and every other nervous system in your body, nearly, and you are completely unable to think, or do any thing else, and you are reduced to a mere pumping heart patient, with not much else going for you, except you are breathing, and technically, you are alive. You can sit there for a

million years, or a million or so life times, before you begin to come out of it, and then reveal your disorder of severe mental disorganization, mental disfunction, and mental retardation. There is a big difference between a bonk on the head, and a train running over it, and the rest of your body. Coma patients are fully aware of what is going on around them, and they may not be able to speak, but they are there, and they can twitch a finger, now and then, or flex a toe, or raise their tummy up a tiny bit, to pass gas, usually, and relieve the bloating sensation they are experiencing in their tummy, and in their intestines, or colon. They may be able to grasp your hand, and fully hold on to it, and not let go, for hours, if they have the strength for it. This horrible torture the Lesbianists are perpetrating on comatosic patients, needs to end, now. Person responsible for continuance of hospital policies, despite our informing them of the truth regarding this, are to be shot and killed, and sent to my Epcot Center, if they interfere with the removal of the life support and life support assitive devices, that are plugged into the comatosic patients mouth, or nose, or other orifice of their body, or any part of their body. If some one refuses to cooperate, you are to throw them out of their hospital unit, and give them a good whack on the head. Come back in a few days, and then disconnnect their life support assisitive pumps, and tubes, and so forth, and shoot them in the brain with three 'fivers', as I've explained about, and then send them on their way to my Epcot Center. That is an order. Now do it.

I want you to pull the plugs on all the GI's and civilians who are on a breathing assistance machine, and life support assistance equipment, and I want you to send them all to my Epcot Center, where they can get treatment, and therapy, and then get themselves ready for being born, again, as a fine and a healthy, tummy baby to a tummy mommy, and to tummy daddies. You had better comply, if you know what is good for you, as my kids are now keeping track of your records on this account, and you are not going to do very well, if you do not follow orders. Is that clear. I will not have any insubordination of duty on my watch, and that means, you had better learn to follow orders, or you will be asked to jump over board, and then go for a very long swim to shore.

Michael Jackson

Michael Jackson is the biggest joke in the world. He is a white boy, and he pretends to be related to Janet Jackson, a black woman, partially, and they pretend to be related, and he is as white as an elbow macaroni, or a white goose. He is not a black person, though he does have some black ancestry, but he is a primarily white person, and he pretends to have bleached his skin color, which is a crock of shit. Now, I want you to kill that mother fucker, as well as Sylvestor Stallon, and Arnold Schwarznegar, Clint Eastwood, Morgan Freeman, Kirk Douglas, Matt Damon, Robert De Niro, Anthony Hopkins, Gary Busey, and their Lesbianists' buddies.

Retractions

Mr. Jerry Springer is not a Lesbianist. I was mistaken about him, as he was already killed by them, in a previous lifetime, as he developed a desire to bad mouth them, and they didn't like him, and they kicked him out of their group, and they killed him, with their murderous torture routines. Penelope Cruz is not a Lesbianist, but she was, but they killed her, and tortured her, and she is off the list. Angelica Huston is not a Lesbianist. She was, but they killed her, after torturing her. She is a popular and prominent person, and if she hasn't been abducted yet, by the Lesbianists who will feed her to my abominant kids, like they did to Steve Irwin, and Jeff Corwin, then they will be gettting around to it, not too long from now, as they like to feed her to the abominant kids of mine, just as they do Bill Gates, and lots of other, former Lesbianists. None of the Baldwin brothers are Lesbianists, either, as they were already kicked out, and killed by them, and then grievously tortured by them. They continue to be main attractions for feeding to my abominant kids. Jack Nicholson is not a Lesbianist, now, either, but he was. Ben Affleck is not a Lesbianist, as he was also kicked out of their organization, after they tortured and killed him. Charley Sheen is not one, either, but he was. Martin Sheen is not a Lesbianist, but he works for them, and he was one, before they kicked him out, after they tortured him, and killed him, in a previous lifetime. Michael Douglas is no longer a Lesbianist, either, as they killed him, after their brutal torturing of him. He is up for being abducted, and for being fed to the abominant kids of mine, as he is a prominent person, and Kirk Douglas enjoys watching him get eaten up, and Kirk Douglas will laugh his guts out, as he watches Michael Douglas get tortured by the Lesbianists, which Kirk Douglas is a confirmed member of. Cher Bonno is not a Lesbianist, as I was mistaken in memory, though she was a leader for a while with Oliver North, she was killed by them, after being tortured, because she was getting "soft". Sunny Bonno was a Lesbianist, as well, but he was also killed after being tortured, officially kicking him out of the members league of Lesbianists. Sunny Bonno was captured, and abducted, and a body double was placed on a coroner's table, and Cher Bonno knew that the body double who was dead, who looked like Sunny Bonno, was not Sunny Bonno. The Lesbianists subsequently fed Sunny Bonno, after they captured him off the ski slopes, to my abominant kids. Elizabeth Taylor was thrown out of the corp of Lesbianists, after they heinously tortured her, and murdered her, and the Lesbianists have her slated, scheduled, after they find a way to abduct her, for feeding her to my abominant kids. Dennis Miller is not a Lesbianist. Though he was one, after torturing him, and sushi-izing him, please see my notes on that, the Lesbianist's sushi-izing of Dennis Miller eventually killed him.

It's hard to keep track of some people, as to whether or not they are currently Lesbianists. Others, are not so hard to keep track of, and I want all of those mentioned, killed, immediately.

On Praying, Fucking, Sucking And So Forth

You are rewarded for praying Nam Myeo Ho Ren Ge Kyeo. You are also rewarded for fucking, sucking, tounging, licking, fingering, dicking or massaging your dick against a woman's bun bun, or inside of her butt hole, where there are lots of sensitivities buttons that get her clicking and eroteming and orgasming, or against her titties to get her eroteming and orgasming, and so on, and for palming or massaging a pelvital button, or the love and joy stick, the dick, or a love button or love patch, igniter switch, or whatever nerve sending touch sensitive love joy button there is embedded into your body, in the pelvis, groin, vagina, and in the musculatures of the groin, pelvis, and vagina, with the palm of your hand, and so on. You also get rewarded for throating a woman with your dick, as there are lots of love buttons in her mouth, and throat, lips, and so forth. Men also have love buttons in their lips, throats, tounges, mouths, butthole, and on their body, and those buttons also get clicking, and turning on and off, and sending sensitivities messages or signals, nerve pulses, up the eroteming nerval system and up the orgasming nerval system. You get rewarded for dicking men and boys in the throats, and in the buttholes, and their bodies, just as you get rewarded for dicking women. There is no discrimination in this area, and every one is

equally rewarded for their meritorious acts of dicking others, women, girls, men, and boys.

Why are you rewarded for praying Nam Myo Ho Ren Ge Kyeo, and for dicking, fucking, and sucking, bumbeying, or moving your vaginal bumbey package against a woman's sexaling body parts to erotemize your self, and the woman, and for breasting your titties, i.e, rubbing your titties against or flopping them against and massaging them against a woman's butty butt or against her other sexaling body parts to get you and your friend sexually erogenized i.e., sexually stimulated, erotemized, and orgasming, and for other sexaling activities that help you and your friend and friends to produce purifying sexaling energies?

You are rewarded for your praying and for your fucking, sucking, dicking, and so forth, for helping to get every thing and every body going at the right pace in synch with every thing and every body else, for every body in my universe who is working for me, to keep them moving in harmony, perfectly meshed and in synch and in a timed persuasive mosture, with each other, so as to keep my universe standing up, strong, wholesome, robust, healthy, well, and fine. You are rewarded for praying as well as for sexaling, as you help move my children along as they do their work, as you pray and as you sexal and spray out energies from eroteming, from erotistically orgasming, and from sexually orgasmically convulsing, i.e., phlumetting, while you shatter out and spray out purifying energies in all directions, that will clearify and erase your karmic markups, and the karmic markups of others, all around you, for millions and more of miles, way out beyond where you are activiating and religialing, i.e., sexaling.

Your dicking, sucking, licking, titty massaging others, and so forth, will get wonderful and wholesome, GODLY, purifying energies shooting out of your bodies, and the energies shoot out at rates of speed that also help my universe to keep synchronized, and to move along at the right pace for it to be able to stand up and remain stable and solid, durile, strong, wholesome, pure, and a nice place to live in.

Every one who works for me, has a rate of speed they work at, a life pace, or life spin.

We all have a pace of life. In some cities, it is fast and hustling. In some places, it is slow and whimsical. My kids work according to a rate of speed that is metered, and they keeps every one moving as best as they can, according to this metered pace.

The metered synchronized pace that my children work at the rate of is one thirty seventh and one fifth, approximately, on the metronome.

If you help to push my kids along at that rate of speed, or a rate of speed that is close to it, as you pray at a metered synchronized pace and rate of speed, and as you fuck, suck, and so forth at a metered synchronized pace and rate of speed, then you are rewarded with angel

dusts, or purifying energies faerie dusts that my kids daub on your head, and throw buckets loads of over your head and body and that they wash your insides out with and that they wash your body, inside and outside, with as they shower them all over you on the outside of your body, and all around in your body on the inside of you, which then help to clean you up and clearify your karmic markups, cleanse your karma, and purify your life, making you a shining, radiant, pure and holy being, though you may not notice at first, as we are too filthy, karmically speaking, to notice the changes, as our karma is too thick and mucky to allow us to feel the changes that are taking place in our karma and life.

I have a gradient scale for how close you keep people moving, and at what rate of speed you help to push them along, and as you help to push my kids along, so that they can do their work, you are rewarded, in accordance with my gradient scale, with more angel dusts or purifying energies for better preformance, and with less angel dusts for poorer or less effective performance.

You have to do some thing that will help my kids move along at a metered pace, so that they can get their work done. Praying Nam Myeo Ho Ren Ge Kyeo sets off a time frame synch. A time frame synch is the metered click, click, click, of the metronome. This time frame synch or metered pace, that you achieve while praying, Nam Myeo Ho Ren Ge Kyeo, will help keep every one moving, at the right pace, if you pray it in a rythym and at a rate of speed that will synch up with a metronome at one thirty seventh and one fifth, approximately.

Your efforts to help keep my kids working and moving at a consistent rate of speed, will get rewarded, thus for praying, Nam Myeo Ho Ren Ge Kyeo, you are rewarded, with purifying energies, that my kids dump on you.

Your efforts for fucking, sucking, licking, tounging, titty whipping or banging your titty nipple against the vagina of a woman or girl, dicking, fingering, palming, and so forth, all get rewarded, if you try to keep every thing in synch with the metered pace of the metronome at one thirty seventh and one fifth, approximately.

The gradient scale also applies, of course, as you are fucking and sucking, etc., so the better the job you do of keeping your pace at one thirty seventh and one fifth, approximately, the higher your rewards will be. Your rewards are the same, more or less, for both praying and for fucking and sucking, and my kids sprinkle and dump angel dusts, purifying energies, on you as a reward. You also get markups that are meritorious, and you are rewarded with a better and happier life.

Further, when you are orgasming, and eroteming, or pushing out energies as you orgasm, and erotem, you will be pushing out energies that shoot out at consistent rates of speed. These rates of speeds of these energies are in concordance with our pace of life, they all

perfectly mesh with the paces of life that my kids keep. The energies as they pass out, and push along through time and space, at synched up and consistent rates of speeds, all help to keep my kids moving along as they do their work and tasks, and they all help to keep our universe, standing up, strong, healthy, wholesome, well, and fine.

Chaos breaks the legs off the foundation to our universe, and our universe begins to creak and moan, as it begins to crumble, slide, twist, and tumble downwardsly.

Making chaotic noises, and chaotic movements, detracts from the harmonics of our universe. Your breaking glasses, and breaking skulls, and legs, and arms, are also chaotic events producing, in most cases, and they will detract from the perfect synch up of our universe, as leg bones and arm bones, skulls, fingers and toes, begin to splinter, as you apply pressures to them, you get negative markups for your actions. A record is kept of every chaotic action you take, or make, and if you make enough chaos, in your lifetime, and in your following lifetimes, then you will suffer from your poor records of performance for keeping my universe standing up, wholesome, healthy, happy, and well.

Every scream you cause to be vocated or vocalized, is recorded, and the intensity of the scream, and yell, and crying out in pain, plus a lot of other factors involved, are all recorded by my kids, and you get negative marks for that kind of performance.

The love making oooohs, and aaaahhhs you cause to be vocated, are harmonic appeals of soothing restfullness to the spirit, and to the mind, are also graded, and you are graded on how well you can cause others to produce them, and your scores are kept, and if you are a lousy performer, with more negatives than positives, you'll end up with a lousy life, as a result, as you are rewarded in accordance for your positive performance, as well as for your negative performance.

Helping to keep all of my children working in harmony, and doing their jobs and tasks, at a metered pace, will be rewarded, not only with angel dusts, but also with a better life with more positive fortune, as you recieve positive points or merit points for your collaborating with my children, and working to support them, and more fun as your life becomes graced with more positive merits and as your rewards begin to pile up, and more good things begin to go on in your life.

If you sit on the side of your chair and have a pair of drum sticks, or are using a bongo drum, or calypso drum, with the long tube belly, or stack, a long barrel tubed drum, or if you sit at your drum set, or set up your electronic drum pads, and begin pounding away, in a syncopated manner, for your pleasure, just drumming away, with no notion in mind as to any thing other than achieving a nice rythym for you and your friends to listen to, if you happen to be with friends, your merit points will be near zero, and your efforts will not rate on my gradient scale, as your actions will not be in accordance with my

program for a better universe for all people, and for my kids to live and work in.

If, however, you have the attitude, "I wish to support John's kids, and syncopate myself while I'm drumming, so as to be supportive of John's kids, to help John's kids work in a syncopated manner, doing all I can to support John's kids", then, your merit points as you drum, will go sky high, through the roof, and you'll get meritorious benefits for your efforts, or merit points, and good marks, for your efforts. It's like helping kindly old women, who are frail and in need of a helping hand and support, cross the street. If you act in a kindly and charitable manner to help support those around you, you get meritorious points for your efforts. These efforts of your's, however kindly, regrettably, though they are kindly efforts, are not the kinds of efforts that we need, my kids and me, need to keep my universe standing up, and moveing strongly. For efforts that support my kids work environment, and that lend a hand to them to help them to get their work done, your meritorious efforts marks will go through the roof, and you'll be blessed with angel dusts, i.e., purifying energies that help to clean up your karma, and erase and clearify your karmic markups, or marks that record your bad and cruel, or negative actions towards others, and towards your self. You can kill your self, and cause grief to others, as a result of your departure, to my Epcot Center, and that rates negative marks and negative points markings or markups for you.

When you try to do any thing, that will help to syncopate my children, and to make my children's working environement more syncopated, and rythmical, with your concentrated mind, and determination to make that a reality, in other words, a prayerful attitude in mind, hoping to make John's children's working environments syncopated, and rythmical, and in rythym with every one elses', i.e., all of my other kids' syncopated working environements, then with that attitude of hopefulness, or a prayerful attitude, than, you are rewarded for your efforts, and determination, and as you drum away, or pound and beat on your calypso drum, or on your metal Bahamian or Tinian, or Haitian, or Jamaican, drums, or on your dresser drawers, if your mom does not mind, as you pound away, keeping your mind set on your determination to keep all of my kids working in unison with each other, and helping them to keep in syncopated harmony, all in perfect flux, and perfectly meshed in timing, with every one else, as they work for me, then your rewards and positive points markups, will be very high, and you'll be rewarded by my children, with angel dusts that they daub on your forehead, and dump all over you, from their barrels they carry full of angel dusts, or purifying energies to clearify your markups from your karmic markup piles, kept inside of your body, kept in storage in the molecules.

Your markups are inside the molecules inside your body, but they are also out side of your body, in every molecule, nearly, going way out to the very farthest edges of my universe.

We will eventually get to all of them, and purify or clearify and erase all of your karmic markups, the notations and records that my kids keep on you, and on your activities, and eventually, we'll get them all, and your life will then be full of grace and happiness. It will be a long time before we get to all of them, as you and I and every one in my universe, have been here, and enormous length of time.

As you drum, or skip, or dance, or do areobics, in syncopation, with the attitude that you want to keep all of John's kids in step, and in synch, and in unison and harmonicly meshed and in perfect flux with each other, or perfectly meshing with each other, and every one else who works for me, whether you drum, skip, dance, or do areobics, it does not matter, if your mind is set and determined to help my kids, with your efforts, you will be rewarded for your efforts, no matter whether you skip, jump rope, dance, or areobically excercise.

As you sexalate, if you keep in your mind that you wish to keep all of John's kids in syncopated harmony, perfectly in flux, and in unison, just as when you are drumming, or skipping rope, or dancing, or playing basketball, or playing tennis, or badminton, or any sport, with your movements all timed, and in perfect syncopation, when you sexal with the right attitude to keep John's kids in synch, perfectly meshed in perfect accordance and flux, with each other, and with every one else, you will be rewarded grandurally, that is, grandly, or in a grand or very great manner.

Excercising And Activiating To Music Timed To One Thirty Seventh On The Metronome

Music timed to one thirty seventh on the metronome, and one fifth, or as close to one thirty seventh on the metronome that you can get, is okay, and it will help you to dance, play tennis, play sports, do areobic excercises, and other types of activities, at that pace that we need to keep to help keep my kids working smoothly, and you'll be graded on your performance, and on your attitude while you are dancing, or excercising, and the more intently you concentrate and use your mental energies and mental control to stay in synch, and in step, the better will your scores be, and the higher your marks, and the greater your rewards of purifying angel dusts and purifying energies that my working and unionized kids will pour and spread all about you, inside and out, and all over you.

Sexaling itself is a religious act. Yes. That's true. But, if you sexalate with this powerful prayerful attitude, or hope in mind, with your determined mind, and your concentrated mind, as you sexalate, and help others to sexalate, and help others to erotem, orgasm, phlumett, and shatter off wonderful energies from orgasming, eroteming, and phlumetting, your positive points and merit marks, and many other types of scores my kids keep on your efforts and behavior, all of them will go higher than any one can see, way out beyond the furthest galaxy that you can possibly see from your bedroom window, with your telescope. They'll go out to the futhest edges of my current univerese, and even beyond the barrier walls, holding up our universe,

that my kids put in, to keep our universe standing up, stable, strong, and durile or durable and with tensile integrity.

Any action for helping my kids do their work, syncopated, and in unison, and in harmony, will be rewarded, with angel dusts, and with positive marks and score points in your records that we keep on you and every one else in my universe.

Your sexaling actions get rewarded, far more than any other activityating, as your sexaling actions are the most needed actions, to keep my universe, pure, durile, holy, sacred, free from negativities, healthy, wholesome, stable, and constantly in a state of improvementing.

Most people go around destroying things, and causing chaos. We, my kids and I, need people who are going to help improve the wonderfulness of our, my, yours, my kids, and all of my other kids, wether they work for me, or not, meaning, all of my guppies, who are like you, my relatively normal kids, as well as all of my abnormal kids, the abominants kids I've got, that go around thinking it is funny to eat people, and to pull them into their mouths, and crush them in miserable pain and agony, like my elephants abominants kids do to relatively normal human beings kids of mine.

Fisting And Punching People With Your Clenched Hands And Crasping Or Clasped Knuckles

You all have been bad kids, all of my guppies, all of you who do not work for me and go around thinking, 'Oh, gee. Aren't I special.' My guppies are these minded people, who are arrogant, who talk back to their mama's and to their papa's, and to their relatives, and brothers and sisters, and to their friends in school, and to their teachers. Later in life, they become worse, and they talk back with their actions of being mean to each other. As my guppies grow older, and become older people, they start fisting others, and that means, punching people, hitting them with their clenched fists and hard knuckles, and hurting them when they pound on their face, or on their stomach, or on their body some where, and break bones, and tear muscles, and stretch ligaments with their pounding each other.

Phlooching Out And Fisting The Vaginal Cavity, Rectal Cavity, And Mouthal Cavity

Fisting is a word used by some people to mean, to insert your hand into the vagina of a woman, and gay people, homosexually driven people, fist each other in the butt hole, if either men or women, or in the vagina, if women.

Some people find it interesting to fist each other in the mouth, by sticking their fist inside the mouth of a person, pretending it is a dick or a dildoe.

You need to phlooch out the neck muscles, and billow them up, or poof them up and out, and that will help them to gently relax, and then become expandable or stretchable, as when they relax, they will easily stretcth out, and there will be some give, or freedom of expandingness. The neck muscles then become easy to stretch and push on from the inside with out hurting the person. It then is easy to insert your fist into the throat, to massage the inside of the throat, and to use your hand, or fist, to tickle the igniters, and triggers that set off love buttons and bells, and whistles, that help women and men to erotem, orgasm, and phlumett.

Fisting by inserting your fist into the vagina of a woman, when it is relaxed, and after you've massaged if for many hours, and after it begins to billow out, or poof out, and then open wide, and then you can see inside of it, and from the entrance of the vagina, there is a clear gaping cavity, you can then insert your clenched fist hand into, to massage the inside of the vaginal cavity. Doing this is very nice, and is very exciting to do, to help women and girls to erotem, orgasm, and phlumett. You can phlooch out the butt hole, by massaging it, for several hours, and it will begin to poof out, and expand, and you'll see a nanny gate face on it, and that means, it will begin to look a little bit like a vulva, or the vagina of a woman or girl when at rest, or exposed between a woman's or girl's legs as she is sitting or relaxed with no panties on or with no or few clothes on and nothing covering her hips, pelvis, lower pelvis, pelvital ridge, crotch and groin, butt and butthole and lower back, there by exposing her butt and vagina. If you compare a vagina with a phlooched out butthole, you will see they resemble each other, slightly. There is no vaginal cleavage of course, around the butthole, but there is a slight resemblence between a phlooched out butt hole, and a vagina, or vulva, none the less.

The Vagina And Vulva Compared To The 'Nanny Gated' Butthole

What is the difference between a vagina and a vulva? They are more or less the same, but the vagina includes lots of parts, inside as well as out side. The vulva is outside, basically, only, as far as I understand and remember these things, now.

When you massage a butthole, long enough, it will begin to look like a vulva, or vaginal face. That's called the nanny gate, or on the male, the male butthole vagina, as I've spoken about it, before. On the woman, it is the female butthole vagina, a double 'immitation vagina' for the real one, as I've mentioned. Men's and women's buttholes are the same, and they both look like 'immitation vaginas' as I've also mentioned, after you phlooch out the butt hole of either the female or of the male.

Once you phlooch out the butthole of a man or of a woman, it will poof out, and expand, and the butthole entrance and cavity will become relaxed, and easy to insert your clenched fist into, to then push up your fist into the butthole cavity, and massage it, once the person has cleaned out the butt hole cavity and once it is clear and free

from debris matter, or food matter, and rotting food particles, and fleshy foods, or hamburger meat and so on. Phlooching out the vaginal caivity takes a little longer, but with patience, you can phlooch it out, and then fist, in this manner. If you phlooch out the butt hole, and rectal cavity, you can fist your male friends, and your female friends, and every one, once they have cleaned out their poop hole, and made it free from rotting debris, will enjoy mutual, and reciprocal, fisting.

Fisting in this way, for sexaling, is alright. Fisting in the other way, for beating people up, is not nice, and you are given poor marks for your actions of nautyness, meaness, and cruelty towards others.

Over the long course of time, you all have been naughty at one time or another. I have many ways to fix you, and to retrain you, and to rehabilitate you, but you always go bad, and sour, again, as that is your main drive, or driving internal force in your lives.

The Importance Of Kindlyness And Teamwork

Why have all of my guppie kids all gone south, or in other words, gone down the road towards unkindlyness? Because, as I've explained, you forgot what the Love Of GOD is. My religion will help people to understand what the Love Of GOD is, and that will help keep them on the correct path of kindly actions towards others, and it will help them to understand and remember that teamwork to help my working, unionized kids to keep our universe healthy, strong, durile, standing up, stable, a safe and happy place to live, and a wonderful place to live, is very important.

Anyway, doing things that support my kids working efforts, will be rewarded, and doing things that detract from the harmony and syncopation of the metered pace of my kids who are working, and that slows them down, and that causes dischordance, will not be favorably rewarded, and you'll become a female schmuck, or a male schmuck over the length of time, as you live on in my universe. A schmuck is an unlikeable person.

Sexaling is the most important thing there is for us to do, other than feeding ourselves correctly to keep us healthy, and excercising, and leading a balanced, well regulated life, listening to your mama and to your papa.

My religion is based on sexaling, as sexaling is the most holy and pure activity we can participate in, or do by ourselves.

All the bullshit propaganda of the Lesbianists, that Jesus said this, and that Buddha said this, and that God will save you if you do this, and so forth, is pure balooney, bullshit, and made up nonsense.

I will not do any thing for any body, unless you help me and my children to make this universe, a more kindly, and a more wonderful and prosperous universe for all of us. If you do, I will have my kids,

bless you with angle dusts as they daub them on your forehead, and then pour barrels of angel dusts over you, as they dump barrels full over your head and body, for your extra good work, sexaling, in syncopation, with my kids working rythyms, and in rythym with their syncopations, flux, and their phenomenal elegance.

Phenomenal Elegance

What is phenomenal elegance? It is their keeping harmony with each other as they work and keep every thing in order, in my universe for me, GOD.

You can not escape from this reality of your good actions and your bad actions being recorded, as my kids keep records on every one, and we make certain every one is rewarded for their good actions, and we make certain that every one recieves as close to what they deserve, to help balance things out, in accordance with their markups, for their bad actions. If they are bad, they will not meet nice people, and they will meet naughty people, and not so nice things may begin to happen between them. If they are good, and if they try to help my kids, as I've explained about, they will get rewarded, and they will slowly begin to break away from keeping company with bad people, and they will gradually ascend to higher rankings or status, and then they will begin to lead a better life, and they will begin to escape from meeting with bad people, and the good kids' lives will become blessed by my kids, as my kids begin to sprinkle angel dusts on the good kids, and daub the heads of the good kids with purifying energies, and then dump purifying energies all over the bodies of the good kids who listen to their mama's and papa's, and sexal with them, and as they sexal with their mama's and papa's, and sisters and brothers, relatives, neighbors, and others, the good kids help my kids keep this universe running smoothly, in harmony, in flux, perfectly meshed, and in perfect syncopation.

Mama's, papa's, sisters, brothers, relatives, neighbors, and others, all get their heads blessed with angel dusts, purifying energies, for their good actions along with the good kids, you, I hope, of course, too.

Plurlbalescent / Plurablescent Nature Of Negative Punishments And Positive Rewards

This is very important for every body to understand. I have my working, unionized kids reward the good people, and I have my working, unionized kids keep records on every action of every one of you, and I have my kids make sure the bad kids, meet with what they deserve, or some thing close to it, which may not be too nice, most of the time, and I have my kids make sure that the good kids, all meet with what they deserve, or something close to it, and that is usually always something nice. It may sometimes not be something conspicuously nice, but it is nice, usually, or positive in nature, always. The bad kids will get rewarded by something that is negative in nature, always,

usually, or plurlbalescent. What does plurlbalescent mean? It means, it might not be noticably negative, but it is still negative, in nature, in essence. This is a topic we can discuss, another time, or you can ask my kids for more information on it, when you go in and visit them, with your mama's and papa's, sisters and brothers, relatives, school teachers, principal, costodians, janitors, school workers, and others.

We have had too much chaos of late, and for quite some time, and it is now time to slow it, and bring it to a halt. We are going to produce positive harmonic concordances that will assist my kids as they work, and that will help them to stay working in harmony with each other, with your fucking, sucking, eroteming, orgasming, your shooting out of purifying energies as you orgasm, and erotem, and with the increase of the oooohs, and aaaahs, you help to produce, with your practice of my religion.

We have to bring an end to the moronic violence of the Lesbianists. If that requires a lot of my children, making lots of babies, and lots of energies, and percussive forces, when you set off a fracturable rock bomb, then that is what it will take, as you blow Washington DC and the Baltimore metro area off its ocean ledge, and into the Atlantic, with that fracturable rock bomb, if it is big enough.

Yes, there will be lots of painful, ouches, and screams, and so forth, but it is trite, compared to the violence these idiots have been perpetrating, over the long span of time that they have been in my universe.

We have been here for a very long time. It is nearly impossible to figure out how long, other than with mathmatical computations. Our brains will burn out, if we try to figure it out in our heads.

It does not matter how long we have been here. It does matter what we do while we are here. You are not going any where else, and you are all staying in my universe, so you will all drop your pants, and your dresses, remove your shoes, socks, clothes, underwares, panty hosees, and panties, disrobe, and begin helping others to make lots of ooohs, and aaaahs, and lots of eroteming and orgasming energies. That will be the begining of your getting into line with the rest of us, here in my universe, my kids who work for me.

As you eroto with each other, you'll get graded on your performance, and you'll get paid by my kids, once you join our country, as I've explained about, before.

Timed Persuasive Mosture

What is a timed persuasive mosture? It is just keeping every body in synch with each other, persuasively and accurately moving along, orderly, in an ordered fashion or manner, and with every body in rythm and syncopated with each other.

Mosture is a type of motus, or motion or fluidity of movement. The timed fluidity or fluidness of my kids working along in synch with each other, is critical to having every thing in my universe, standing up and sturdy, with every thing holding together, as it should be.

Otherwise, if my kids and their work get out of synch, things can come crashing down, and things can come falling apart, and we do not want that.

This is a big universe, and we have a lot of people in it, my kids, and you wouldn't believe how many kids I have. Anyway, they all have to stay in syncopated, fluid motion, with their paces of life perfectly meshing with each other's paces of life, to accomplish their jobs and tasks, in an orderly, and in a fluid movement, harmoniously, and without delays.

The persuasiveness is accomplished with the help of your sexaling, and by your keeping pace, and synching your sexaling activities, and the movements involved in your sexaling activities, and by your spraying out your energies, as you erotem, orgasm, and phlumett.

The persuasiveness is also accomplished by your keeping pace in unison with others while you are praying the syncopated phrase, Nam Myeo Ho Ren Ge Kyeo.

Every thing is timed, and so as you activiate, or carry out these activities of sexaling, eroteming, orgasming, phlumetting, as well as the movements involved in sexaling, and as you pray, your synching of your movements and sounds in time and in pace with the syncopated and metered metronome click, click, click, at the timed pace of one thirty seventh and one fifth, on the metronome, approximately, helps to persuasively move, or persuasively drive and push, every body about, and along, as they do their work for me, in their many syncopated paces of life, or life spins.

I have many children working at different life spins, as I've mentioned before, and each group of them has a different pace of life, or time spin. Your activiating, as explained, helps drive them along, each at their own pace of life, or time spin, perfectly meshed with every other child of mine, also in his or her, and at his or her own particular time rate of speed, time spin, life spin, or, pace of life.

Every one and every thing must move along in perfect flux, or perfectly meshed with every body, and with every thing that is going on in my universe.

You are rewarded for your helping to move my kids along, in perfect flux perfectly meshing with every one and with every thing that is going on in my universe, with your efforts at sexaling, and with your praying, as explained, earlier.

In our new society, which we will create, you will score earning points, and every thing you do, as you sexal, and so forth, and as you pray, is scored, and a record of your capabilities, or excellence, or

lack of excellence, is kept. You are paid according to your work performance, as you sexal, activiate, pray, erotem, orgasm, and phlumett. Also, you are graded on how well you get along with others, and on how well you try to harmonize and then sexalate with others. You score earning points, accordingly, and you get paid, according to how well you perform.

Keeping Every Thing And Everybody In Harmony And In Synch

Explaining how this works, how praying, fucking, sucking, dicking and hugging, etc., helps keep every thing in synch and in harmony and how your efforts are rewarded, is a tiny bit more complicated than my simple explanation, but that is it in a peanut shell.

Now. For those Lesbianists hiding among you who do not wish to surrender, you Lesbianists will find we are not going to be acting kindly towards you.

All of you Lesbianists, where ever you are in Washington DC, or hiding underground, or in Paris, or in Rome, Peking, and so forth, you will be dealt with harshly, as we need to put a stop to your activities, and a "maybe" is not acceptable in this case.

We are not going to allow you to continue your chaotic, nonsensical, violent activities one moment longer, and we will blow you up flying high up into the sky, and off the ocean ledge down below you, in Washington DC, as we sink your Washington DC area into the ocean, along with all of Northern Virginia, and the ocean coastal area of Maryland and Baltimore, along with large parts of the states of Virginia and Maryland, out to West Virginia, as that area settles down into and below the waves of the Atlantic Ocean, after we bomb it with one or more of my fracturable rocks weapons for mass removal of Lesbianists from the face of the earth and from their hiding places under the surface of the earth.

The Lesbianists in the Washington metro area and hiding under it, had all better surrender to my kids, or they will all get their pants and clothes blown off and shredded from their bodies, if they do not, as they are given a free ride out and up into the upper atmospheres of our planet, and then, beyond. All other Lesbianists had better surrender, too, or they risk getting a free ride out, as well.

Deep Sea Ocean Trench Off The East Coast Of The United States

There is a trench that extends south wards from Washington DC, some times reaching 25 miles out in some places, and in other places, it reaches out to eight hundred miles from the shore. In the north, it reaches out in some places, 85 miles out to one hundred and twenty five miles out, to three hundred and fifty five miles out, to eight hundred miles out in some places, in the south.

It is fifteen miles deep when you go out forty five miles off the coast from Washington DC and from the Chesapeak Bay. The ledge bottom

is found about three and one half miles down, and the mouth of the opening continues for ten miles, approximately, downwardsly, on the western side of the trench.

The It has a gaping mouth, and it opens up and lets ocean water inland, under the continent, eighty five miles down below Washinton DC, three to six to eight miles wide, from top to bottom, from the underside of the top of the mouth, the bottom of the ledge, to the bottom of the mouth.

>From under the nation's capital, to the south, it travels to over eight hundred and eighty five miles. To the north, it travels three hundred and thirty five miles, to six hundred and fifty miles, to about nine hundred and fifty nine miles, inland under the continent, depending on where you wish to locate the edge of it under the continent, northwardsly.

It travels to the west, inland, three hundred and thirty five miles, to just over eight hundred miles, depending on where you find the edge of it. It travels inland further westardsly, the further you travel north. It is slightly over one thousand and eight hundred miles from north to south, in total, as you'll discover, once you explode enough, and after you explode large enough fracturable rock bombs, over Northern Virginia, Maryland, Washington DC, Baltimore, covering the metro area vicinity.

The U.S. Navy, and the U.S. Coastguard know about the trench, or parts of it. They are not allowed to discuss it with anyone. No one is allowed out there, to research it as it is off limits to just about every one. Some navy personel of high rank, and coast guard personel of high rank, are allowed out to take soundings, every now and then, with their Lesbianists' staff members, and Lesbianists' personel in the Navy, and in the Coast Guard.

The Soviets, at least, Boris Yeltzin, Vladmir Putin, Mikhael Gorbachev, and Zelda Gorbachev, know about it, and so do all the other Lesbianists. They can confirm it, if they wish to play ball with me, and if they wish to save their asses, after they decide to surrender to my children.

The Shelfs Systems And Trenches Systems

The shelf estends to under Lexington Kentucky, at about ten miles below it. It is five miles up under Chatanooga Kentucky. It is five miles below Washington D.C., in some areas. It is three miles below Baltimore Maryland, in some parts of the city. It is eight miles up below Pittsburg, Pennsylvania. It is fifty five miles up below, or under, West Chesterfield, New York. It comes up to eighteen to thirty miles below McLean Virgina. It is eighty eight miles below Norfolk, and the mouth, downwardsly, is five to ten to fifteen miles wide open, in a downwardsly direction.

It some areas, it can be found below Ohio, and under Indiana. It crosses under the West of Kentucky, and into the south of Illinoise, five to ten, to thirty miles. It is a variegated trench system.

It extends to Tennissee, parts of North Carolina, Mississippi, Alabama, Georgia, South Carolina, and to under parts of Northern and Western Florida, and is open out and into the Gulf of Mexico.

The whole area of Eastern U.S.A., is sitting on an open shelf, trench system, and there is water passing below it, and out into the gulf, in several areas, over to eighty five miles west of Corpus Cristi, Glen Garden, population eight hundred and fifty, which south of Galveston, and north of Corpus Cristi, between the two cities. There is a mouth eigty five miles south of Tampa Bay, Florida, in the Gulf of Mexico. There are several openings or mouths to the underground fault line system, and deep sea ocean trench system, and shelfs systems, and water is passing from the Atlantic to the Gulf of Mexico.

There is also a trench system in the north, under Niagra, that extends southwards, several hundred miles, and it has many branches to it, and it extends into this system of shelfs, trenches, and under continental water flows.

Side Bender Currents

What is a side bender? It is a current comeing out of the mouth of an opening, from under a continental shelf system, that allows waters to flow out. As the water flows out of the mouth, the outlet current of water, it flows very forcefully in an outwardsly direction, and it pushes the water out with great force, generally. If a submarine is traveling in the vicinity of a side bender, the submarine may get hit broadside, and that will often turn the submarine topsy turvy, and around facing the opposite direction it was traveling in, or another direction, not the one it was traveling in, most often. The crew will get swung about inside the submarine, and they will fly through the cabin, and pounce off the floor to the ceiling, and hit the ceiling, and then hit the sides of the corridor they were walking along in, and finally end up on the floor when the submarine rights itself, with its balast, and you'll get many sprained or stretched ligaments, and broken bones, arms, wrists, fingers, legs, knees, ankles, feet, toes, necks, backs, hips, spinal injuries, and other injuries.

It can leave a crew of a submarine nearly one hundred percent, injured and in a ship's hospital, or a Navy or military hospital for recovery. Side benders are often called upwellings of currents by the Navy, but that is not generally the case as they are not upwellings, but they are side pushing currents, that come flowing out from under continental water flow openings, horizontally.

There may be some upwards lift involved, if there is a reason, such as a mouth is angled at a slight sloping angle, as it releases the flowing waters out from its tube like cavity or hole.

Crew members and military passengers of Naval submarine vessels are generally told not to talk or discuss any thing about side benders with non Navy persons, and with persons unrelated to their ship or unrelated to their ships voyage, as the governments of the world, do not want any one to find out about side benders, and they do not want people, geologists, marine geologists, undersea deep sea ocean studies researchers, or others, to research and investigate side benders. It's a big secret, these side benders, and that's what the marines, and the navy personel are sworn to keep, or face a fireing squad, on insubordination, or on some trumped up charge of spreading naval secrets, acting as a foreign spy and receiving money, or something like that.

Naval personel will generally obey orders, and not discuss side benders, or other 'secret' information, with any one, as they risk losing their job, and they might face a fireing squad, or a hanging patrol, sometimes called a marching platoon, or a hanging platoon, a group of soldiers commissioned to carry out orders to hang some one who is in the military.

If you pay a naval officer or enlisted person, or other person with Naval submarine duty, such as some marines, and others, enough money, they may be willing to share some information on side benders, and information about what they know about side benders. Some persons who have had Naval submarine duty, may genuinely not know any thing, such as crew members who are never assigned to submarines that travel near side benders, on a regular basis.

Some times family members of enlisted persons and of Naval officers, are allowed to travel on submarines, for fun and excitement, as a special reward for their papa's or mama's duty on a submarine. Some of these family members have also had some experience with side benders, such as those who have traveled on submarines along the Marianna's trench, or other trenches, not listed, neccessarily on global maps, but none the less, which are there, and that are near shelfs systems under sunken continental shelfs, or under sunken continents, but that eject streams of water, nonetheless.

Our maps and globes of the world are incorrect, the ones we buy through bookstores, or from map publishers, as nothing that would indicate sunken continents, large sunken islands, and related trenches, or other related features, are not going to be indicated on them.

The Lesbianists do not want you to find out information that could provoke you into researching, under water features, that they do not want you to know about, as your fictious understanding they have taught you, of the surface of this planet, and its history, is bogus, and any thing that would conflict with that, is certainly not going to be indicated on a map they would publish, and the map will be wiped clean of all traces of any thing that conflicts with the 'global' history of the earth, as the Lesbianists teach it, in geology courses for high school students, and below, and above.

The global geological history they teach must coincide with their fictious propaganda about Adam and Eve, and "Lucy" the ape woman, the supposed mother of all people living on this planet, and about this earth being only 9 billion years old, or thereabouts, which is a bold faced lie, and other such bullshit notions they have fed every one to swallow, and have forced them to accept, and that they force people to use as primal notions to base scientific research on.

The geology of our planet is much more complex than the Lesbianists are letting on to, and there is much to learn about planetary geology, as these planets have been around a very long time, and many things have happened, over and over again to them, and many things have happened to our 'solar systems', and star formations, and star systems, that people need to know more about, to get a realisitic understanding of our universe, its history, and its many complexities.

In time, we will learn much more about all these things, and you can attend courses that my children have set up for every one, to teach people about our universe. You need a day pass to visit, as I've explained about, before, and then you should swear in, and become a citizen of our country. We have yet to declare this planet ours, but in time, we will, once we have finished and put an end to the problems associated with the Lesbianists, all of their shenanigans, and their malarkying around. One day we will declare this planet ours, and my kids will take charge of everything, and they will appoint people to posts of duty, and to positions of responsibilities.

Making A Large Swimming Pool

People should begin moving off and out of the area, around the Nation's capital, Virginia, Maryland, Pennsylvania, West Virginia, and North Carolina. We'll have a big swimming pool there, with lots of, mostly uninhabited, tiny islets, or hill tops and mountain tops, after all of the current residents die, and pass on and transel over to my Epcot Center, after one of our compatriots, or groups of them, detonate enough of my fracturable rock bombs. People will have to watch out for hungry sharks, after they swim inland, above the sunken landscape, looking for corpses to eat, and to scavenge, as lots of Lesbianists' corpses will come floating up from underground hangouts and cities of the Lesbianists, under those parts of the U.S., and from under the Gulf of Mexico, from under the sea floors of the Atlantic, from under the Niagra trench systems, and from under other trench systems in the Eastern U.S. This is not a joke, by the way.

Stagnasis

Salts kiddies in stagnasis is when they are in the salts kiddies are in their salts crystals cages, in a hibernative state, in perfect equilibrium, to keep them alive and well, for as long as possible.

Black Powder 'String' Fuses

Take a spool of sewing thread, and use Elmer's glue to coat the string, and run the string with a thin layer of Elmer's glue coated on

it, through a bucket of black powder gun powder, which you can order in the mail, over the internet, or pick up at an antique musket or old style 'cap and ball' musket rifles and pistols retail stores.

Elmer's glue and gunpowder will combine to form a minor plastiques explosive, after the salts kiddies mix it up, eat each other up, pee and poop out lots of stuff that is highly explosive, as they get busy making babies, except when gunpowder is used in large quantities with Elmer's glue, to form a major plastiques explosive. Benzine will help this along, with diesel fuels, as well, and with chlorine, we can see some major plastiques explosives in the making, as mama's and papa's begin making lots of children, as they begin mixing it up, and as they all begin pooping and peeing out body fluids that is food for others, that will contribute to the powerfulness and explosiveness of the mixture.

After you make your string fuse, and let it dry out for a couple of weeks, then coat a rag or muslim cloth in oil, or grease, or a mixture of turpentine, gasoline, diesel fuel, and grease, with benzine, and make a paste, and use that paste to coat a thin cloth, such as a muslim cloth, and then let that set and dry for a few days, and then wrap a few sets of 'string fuses' together in a bundle, and place them inside the cloth. It will become a very powerful explosive, in itself, the more gun powder you use with it.

Test it, to see how fast it burns once it is wrapped in a cloth coated with a mixture of grease and fuels.

The thicker the grease, the slower it will burn. The thinner the grease mixture, by adding more turpentine, or benzine, or paint thinner, the more rapidly the fuse will burn.

You will have a very powerful explosives cocktail, with this mixture, so be careful.

You have to be very careful with what you combine, as you'll be bringing together very explosive elements, when you mix these fuels and liquids together with gun powder on a string.

A few string fuses, wrapped in a well soaked cloth, with a mixture of these liquids and the axel grease, will make a type of plastique explosive, that can be used as a shape charge, or a mouldable, or shapeable, explosive, that is good for blowing doors off hinges, such as at pharmacies, or banks, and for blowing locks on private homes' fences to pieces, such as can be found at the White House, at 1600 Pennsylvania Ave. Washington, D.C., at the entrances and exits gates of the White House where guards are on constant duty patroling the area for security purposes. An initial explosive, a detonated fracturable rocks bomb, small in size, may cause a concusive force to cause the guards to black out, and pass out, and then sleep for a while. Be very careful with the size of the bomb, as we do not want to level the homes and buildings surrounding the White House, or across

from it in Layfayette Park. After you put them to sleep, with your initial blast, you can test the shape charge on the nearby fences, at the White House.

Black Powder 'Cap And Ball' Pistols

Most black powder cap and ball pistols and rifles, muskets, sellers and retail outlets can be found on the internet, and some gun shops carry black powder, as well as the detonating fireing caps, for black powder rifles, and pistols.

Many of them do, and you can purchase the black powder and copper detonating, ignition caps, for useing in your cap and ball pistol, or musket, or other, more modern, hunting rifle, that allows you to use black powder, and detonating copper caps that slip on a small round fireing ignition nipple that is made out of steel, and has a hole in it, to allow the percussive explosives in the firing copper igniting cap to ignite on impact with the hammer on the weapon, when it slams down on it, and the flames from the igniting explosives mixture, glued to the inside of the firing copper cap, then ignite the black powder, that was rammed down the barrel, or packed and tamped down in a cylinder of a percusive black powder cap and ball pistol.

The caps are fairly useless, unless you wish to add them to a fuel oils, chlorine formula, and let them sit in the fuel oils mixture, and that will help develop plastique, as well.

Higher Temperatures Develop More Useful Energies For Making Babies

The copper in the cap will also allow for a higher temperature in burning, when the fuels mixture ferments after a few weeks. Magnesium in the cap as well, will also help to raise the burning temperature of the fuels mixture, and with some black powder added, and with some chlorine added, your plastiques recipe will become even more useful. These higher temperatures will help to produce energies that will be conducive to baby making among the fracturable, or rupturable, and percussive, rocks radiological salts kiddies.

You can then add a handful or more of powderized amethysts, or turquoise, that you can purchase in bulk, on Ebay, for some small bulk quantities, and also emeralds are useful, as they all have fracturable rocks kiddies embedded in them, and fast asleep, in stagnasis.

Zircon Diamonds, And Other "Radio Active" Gem Stones, Etc.

Zirconium is a mineral that they use for the fake diamonds they sell with the trade name, Zircon diamonds, or Zirconium diamonds. You can powderize them, and use them for a good amount of fracturable rocks explosives, large and fast family making, salts kiddies, for a 'nuclear' party, and a send off to the eastern coast of the United States, before it is blown off the coastal ledge it sits upon, and then sinks below the ocean waves, if you strike it hard enough, with one or more of my fracturable rocks babies making, "nuclear" salts

kiddies bombs.

You'll need a few handfuls of Zicon diamonds, powderized, to make a nice fracturable rocks, babies making bomb.

You can mix turquoise, emeralds that are mined and sold in bulk quantities on Ebay, amethyst, and the other rocks that I've mentioned, along with powderized 'sand' from the beach. Argentina, and Venezuela, Baha, and Southern California are good places to collect useful sands, full of fracturable rocks, salts kiddies, that a geiger counter will detect, if it is a sensitive enough geiger counter.

Geiger Counters And Their Usefulness

They are not too hard to build, but you will have to look in your Popular Mechanics magazines, for the details on how to build a "geiger counter". Some mining stores, and mining outfitters stores, may be a useful places to order or purchase a geiger counter, if you are on a family budget. You might find one on the cheap, on Ebay, that is still useable.

There are some kits available, if you look hard enough, to use to build your own geiger counter. A mining outfitters store, in South America, or in Central America, or in Utah, or in Nevada, may be able to help you locate a kit, to put together, if you go in there, and pretend you want to go out and look for interesting rocks, and you need some information on where to look for interesting rocks, so go to a mining outfitters store, or to a rock hounding club, or rock hounding retail store, for looking at beautiful stones that rock collectors, or rock hounds, have found, and made available at the store. Usually the store owner will have his or her suppliers, on name cards, and you can get in touch with them to get more information on where to look for interesting rocks to test with your geiger counter, since you are facinated by radioactive elements in rocks, and you are interested in finding some, for a collection you wish to start.

You might want to pick up some primer books, on minerals and rocks, gems, and gemstones, from Amazon online, or from a local book store, such as Barnes and Nobel book store, which has a few useful books on rocks, mineral rocks, gems, and gemstones, that you can find when you are out rock hounding.

Desert Outfitters in Las Vegas, a miner's outfitters store, that also provides useful tools to rock collectors, such as rock hammers, and hand held pick hammers, for chipping away at rocks, to see what is under the surface of the rock, or under the peel of it, the outer layer, as well as terrain maps, and outfitting supplies, tents, and sleeping bags, and so forth, has these types of books, and lots of maps, and maybe they can help you find useful kits to purchase, to build yourself a geiger counter. They also sell geiger counters for about three hundred and fifty dollars or so.

Sears used to sell Geiger Counters, and they still can order them for you, I think, through their catalogs. On Ebay, you can find many reasonably priced Geiger Counters. How well the geiger counters work, the ones people sell on Ebay, I can't say, so you'll have to talk with sellers, and see what they say about the geiger counters they are selling to others on Ebay, or read about them in old copies of popular mechanics, and in trade publications for the mining industry.

Novice And Amateur 'Rock Hounding' Rock Collectors Clubs

On Sahara, east of Las Vegas Boulevard, there is a rock shop, which is about two and one half, or so, blocks down from the intersection, on the north side of the street, and they have information, as well as lots of primer books, on rocks, and on geiger counters, and where you can find them. They are well connected to the local rock and gem, minerals and gems finding, or rock hounding clubs. You can meet their members, and go out with them, on excursions, as they know where to find just about anything.

There are similar clubs in every major city, and in lots of smaller cities. Mining towns of course have lots of mining outfitters stores, and they probably have geiger counters for sale, so you can use it to find some very nice, fracturable rocks, along coastlines, or in ancient dry lakes and seas, sediments filled, rock hounding areas.

Decontaminating Your Self With Ocean Salts

Acidic ocean salts in ocean water will help eat up the radiological kiddies that find their way into your bodies, and that make you feel ill. It might take several weeks for initial recovery, with you taking large amounts, several teaspoons or more, as much as you can handle, in your diet, every day, for up to three to eight years, to thirteen years, for severe contamination, and for full recovery.

Other things, such as nutmeg, and oregano, in a salty tea brew, will also help you, and marijuana in the salty tea brew, will further help you. Berries can also be of great benefit for recovery from radiological salts kiddies contamination.

My kids have a recovery kit, that will help you recover from an overdose of radiological salts kiddies, after a major birthing event, and that kit will help you fully recover. You need to join our country, and swear in, and become a citizen, to be given one of these kits to help you for your recovery. They can provide you with information, of various kinds, once you swear in. They have you swear in as full time citizens, now, except in special cases.

Ancient Dry Lakes

There are many ancient dry lakes, up north, in the colder areas, of Manitoba, and around the edges of wet lakes, you'll find areas that dried out, a long time ago, and you'll find interesting things in the sediments deposits under the surface soils of the earth, that have covered most areas, and that come in to our atmosphere, and then

deposit themselves onto the surface of our planet, as they are blown in on the solar winds. A few feet of top soil may cover the dry lake areas, around the edges of these lakes, and the soils depths may reach to twelve feet, to fifty feet, to sixty or to eighty of more feet, in some areas.

Once you hit the sediments layers, around the edges of these lakes, outwards to eight to fifteen miles, to thirty miles or further, out to up to eight hundred miles, as in the case of Lake Erie, and that lakes region, the Great Lakes, that all use to be one large salt water sea, but is now, a fresh water set of lakes, you can begin looking for the radiological bullets of the previous catastrophes in my universe, that shot out radiological salts kiddies, into the sediments rocks of mineral stones, and sand. Gravels might contain some "radioactive" fracturable rocks, and you can tell which are the useful ones, with a geiger counter.

There are still salt water lakes up in Manitoba, Lake Huron, and some others, that used to be part of Lake Erie, and all part of the Great Lakes, when they were a large, salt water sea, but which are now, no longer part of that lake region system of lakes, as fresh water now fills up the Great Lakes from under ground water systems of fresh water flows.

Hydrolific Pressures From Water Falls

Hydrolific pressures, from water falls, primarily, help to erode and carve out and build the under continent open areas of water flows, that flow under the continents, and that dump their waters by traveling underground, in culvers, and channels, and in trenches systems, and then flowing out and into the oceans, resulting in side benders currents and flows.

Underground Lakes

Hydraulisis is one type of water pressures. Hydrolific pressures are those pressures created by water beating down, steadily, as water falls from higher to lower places, creating underground holes, and large open underground cavities, and water holding vessels, aquafirs, and underground lakes in the underground rock layers. Lots of cities sit on top of such underground lakes, on the crust of the surface of the earth, or very near to them. The lakes are often ovular and rounded in shape, from top to bottom.

Many former water falls, are now low lying, and flat, and there is no water fall on the river, except for minor, cascades, such as found in the Grand Canyon Rift Valley down the Colorado River, and out into the Baha area.

Baha Mexico

Baha is a good place to go looking for interesting, "radio active", or radiological rocks, fracturable rocks with radiological salts kiddies

sleeping soundly, embedded into other rocks, after colliding with them, in a hail of radiological rocks bullets, after a planet or a galaxy, or a large nebular star system, or a cluster of them, were detonated, by some fool with a huge and powerful, home made bomb. This happened, often, in the past, and still, today, it happens, now and then.

Bits and pieces of the radiological rocks will come flying in, and then embed themselves into other rocks, as I've explained about, before. We've had so many catastrophes in my universe, that our ancient rocks, are peppered with radiological rocks that are embedded in them.

Off the coast of Baha, is a good place to go diving, looking for rocks that were washed off shore, as waters flowed down the Colorado River, trinities of aeons ago, when this planet was still a young planet, maybe about one fifth the way through its infancy, after reforming, again, after its last major impact that shattered it to pieces, for the umpteenth kazillionth, plus more, time. This shattering and reforming, has been going on too long to count, and obviously, there is a large amount of mixturing going on, with debris from other star systems, galaxies, nebulas, and so forth, floating in, and becomeing part of our planets, all around and about, on solar winds.

You'll find rocks on the inside of the Baha coast, and on the outside, as well, and along the Baha coasts. You might have to dig down thirty of fifty feet, to a few hundred feet to find them, maybe eight hundred feet, or sixteen hundred feet, or further, but you'll eventually find something useful with lots of radological bullets embedded in the rocks.

Finding Good Rocks

You can find interesting rocks, also on high hilltops, such as in the Andes, the Himilaya's, the Swiss Alps, high mountains in Austria, and in Germany, high hill tops and mountains in Iran, maybe in Afganistan, and the very high hill tops, that are generally old hills, in many countries. They will usually have, if they are very old hill tops, lots of rocks scattered about that are very old, and that have lots of fracturable 'radiological' salts kiddies, and other related kiddies in them, as well.

Sledgehammering Continents And Land Areas Where Lesbianists Live, Hiding Below

Here are a few places to place some other fracturable rocks bombs on, to make them fall in, and collapse down onto the layers of rocks, below, and then puncture the ceilings of the cavernous cities the Lesbianists have made, down below those lower rocks layers.

Topango in the South Pacific near the Marianas, the area midway between the Ryukyu Islands and Haha Jima, Chichi Jima, and Iwo Jima, where you will find a sunken continent, Wellington New Zealand,

Peking, Falklands, Urals Mountains, Chile thirty miles north of Concepcion and eighty miles east of it, near the Argentina border, and the Kamchatka pennisula, which will split and collapse in the center of it, midway down the penninsula, if you hit it hard enough. Lesbianists will come floating up, if their bodies can fit between the tons of debris that will fall in on them, as you smash the land sites that sit on top of ocean shelfs, and on open lakes below the land, some miles down from the surface, in some cases, and further down, in other cases.

It may be hard or impossible to deliver a nice bomb below the ocean above or onto the top of the sunken continent below the ocean, between the Ryukyu Islands, or Okinawa, and the islands of Japan, called, Chichi Jima, Haha Jima, and Iwo Jima. If one can be delivered there, you'll crush the continent below the surface of the ocean, and that will cave in on the cities, there are more than one there, that are below the protected shelf layer of rocks, above the cities the Lesbianists have there, below the sunken continent, to live comfortably in. The other places aren't so hard to hit. It is just a matter of local interest, and urging of the people there, to take the correct action to help us to resolve this problem, of Lesbianists living below us, all around the globe, in their honey comb, bee hive like canival of cities.

A canival of cities, is a large collection of cities that is located in such a way as to make it easy to get from one place to another. They are conveneint for them to live in as they are well placed, and spread out evenly, using the full extent of the area, as efficiently as possible. The Lesbianists have a canival of cities under the lower rock shelf layers, that are above them, and that help to keep them protected, warm, dry for the most part, but not always, and that are conveniety located each one in a bee hive like, configuration, well placed, with a well designed, layout, with central cities, and with satelite cities. It is well designed and resembles in part, Melbourne Australia, which was laid out, planned and designed as a modern city. The Lesbianists of course, think Melbourne is puny compared to their accomplishments, and of course, with the technologies they had and have available to them, from time to time, they made good use of every inch of space they have available to them, under the lower hard rock, but leaky rock layers above them.

My kids have places and locations maps of all the best places to locate your home built fracturable rock bombs, and so please pick up the information from them, after you have sworn in, as citizens of our country. Also, please see my earlier notes on the sciences that support a correct understanding of radiological particals based fracturable rocks explosives and other helpful and useful explosives you'll need to set off the fracturable, also called, rupturable rocks bombs, i.e., the so called 'nuclear' detonations.

Topsoils

Did you know that nearly 99.9999+ percent of the earth's crust, or mantle, is formed from space debris that has floated in on the solar winds? It's true. Only about 0.000001 percent of the top soil is from local vegetation, globally speaking. The rest of the top soil comes in from above, blown in on the solar winds, as debris from other planets that have been destroyed, crushed, or blown to pieces by idiots with very large bombs, that demolished whole galaxies, or multiples of galaxies, in a few milliseconds, as the instant they blew up, they were so well made, or constructed, and so powerful, they instantly blew up the whole area of galaxies the planet was located amongst.

If for instance, you fill up one third of the large tourist attraction, the meteor crater in Arizona, with one of these fuels and rocks bombs, and ignite it, you'll disentegrate all of the Milky Way, and some what more than that, in one attempt, by my estimation, if the fracturable rocks bombs were made well enough with the fuels bombs, to burn at near or close to, solar temperatures, and if there were enough materials in the fracturable rocks, to get lots of mama's and papa's making lots of babies, relatives, and others. There are lots of different types of salts kiddies in fracturable rocks, and there are other types of kiddies, the radiological kiddies, which are sometimes, but maybe are not always, grouped with the fracturable rocks kiddies. There are many types of kiddies living in radiological rocks. When we send high heats waves energies, and other types of energies into the fracturable rocks, we can get many types of kiddies to begin making babies. If we get enough of the different types of kiddies to begin making babies, we will have one fine and dandy, explosive shower of baby making events. You can get further information on this topic from my kids, and if you tell your friends to check in with my kids, and to swear in, and become citizens of my and my kids' new country, along with other people who are swearing in, and becomeing citizens of our new country, my kids will make certain that every one is protected, and no one is caught outside, when the bombs go off, as my kids will tractor you and all the other citizens in, with my kids advanced teletransportation technologies, before any one can get hurt by the bomb or bombs blowing up, locally, or in their areas. That means, my worker unionized kids are very quick on getting people into the encapsulated living environment every one is living in, below the ground, that my kids built for every one to live in, until we get this problem straightened out, and until it is safely over with. People can continue to live in the encapsulated living environment, after it is over, as we are going to start a new economic and social system, and we are getting started, down below, where my kids are keeping the encapsulated living environment, well taken care of and well managed.

Later on, we'll worry about who comes out, and when, as we have plans for every one, to begin working inside the encapsulated living environment, which is very well designed, and bomb proof, of course. Once every one gets accustomed to the new way of living, in accordance with my religious principals, and in accordance with our new working and living programs, when people have saved up enough money, they can pool their money, and acquire a lease for land up above, on the

surface, and then with more money, they can have nice places designed for them, and built for them, with your input and with your instructions. You will need to study designing homes, and layouts of homes, for large numbers of people, as you will be required to live in groups of people, as the old systems of living, one husband, one wife, and so forth, is out the window, and now we are going for group living, with many members to your groups. When you have got the maturity together to live in large groups, and to sexal with many people in large groups, then you will qualify, and then with lots of earned income, pooled together, you and the members in your group, can then move up and live on the surface, in your well designed home, which my kids will use their technologies to build for you.

This is how we are going to clean up our planet, and get started with a whole new system for living and working with each other, as GOD's children working and living together, begining here, and spreading, slowly, across and throughout my universe, as we bring others into our program, all across the universe, from end to end, from top to bottom, and from side to side, and in every nook and cranny of my universe.

All of my kids, you, who I am speaking to, will learn to live and work together, supporting my worker unionized kids, in our new global, united, and universal society, we will begin to build, on this planet, first, and then later, every where else.

I am the mother and father of all of you, and of all of my worker, unionized kids, as well, all of my kids who work for me, of course, and of all of my living beings, and of all of my animals. We are going to get this big family of ours, together, and we, the human beings, will begin to clean up our universe, by sexaling for a living, and with many other living by the points systems programs, and other projects. We will also begin to get our heads on straight with religious activitiating, in other words, by participating in religialing, in groups, or by oneself, in the encapsulated living environment, first.

As we move along, in time, we will develop our working strengths, and character, and some people will qualify, eventually, for working in my religious brigade, once they realize and understand who I am, i.e., GOD. Others, who do not give a darn about what I am doing, may do as they like, as long as they are citizens of our country, and as long as they enjoy what they are doing, and as long as they add to the welfare of all people in our society, universal wide, as we build it, larger and larger, for all of my children, no matter who they are. We will one day have all of my children, working for me, and if they do not like working for me, they still have to pay the fees for the resources they use, just as I have to, and that means, there is a charge for every thing we use, and it is detucted from our pay checks. Every one gets a pay check, if they work, and if they are disabled, they will get earnings to support them, for as long as they need to be supported, until they are regroverated, healthy, fit, mentally

prepared, and willing and able to participate. Those who do not wish to participate, will work in jail cells, and prison cells, sexaling for a living, with animals, as I've mentioned before, and at carnival and entertainment centers and districts, we will eventually set up, first on and also inside of this planet, in 'encapsulated' carnival and entertainment parks, and later on and within, other planets.

We are going to have all my children working for me, eventually, as I've spoken about before, and in time, most people will wish to work, and when they are mentally prepared to work, they will enjoy their working, most likely, as sexaling for a living, is not a unwholesome way to earn a living, and it is a pure and holy way to earn a living, and a pure and holy way to spend our time, as part of our new working ethics environement. For more information on this, please see my worker, unionized kids, who handle the information hot lines, in our, and your, and their, as well, encapsulated, living environement, which they have built, maintain, and manage, for all of you, and which they are continuing to build and expand on, for the rest of you, who have not checked in with them, yet.

My worker, unionized kids have their own places to live, inside of the molecules that are used in building your living environment, and in your bodies, and in the molecules outside your living environement, as well. They live in all of the molecules, all over my universe, and they work in them, as well. They have their own universes, that they live in, which are all contained with in the molecules in my universe. It is a little more complicated than that, and so see them for more information on it, if you are interested in learning more.

Disintegrating The Milky Way

The Milky Way is made up of not one galaxy, but of several thousand, of different sizes. We don't have the technologies to see too clearly to distinguish the different galaxies that are within the borders of the Milky Way, nebular star system and nebular star cluster system, another way of saying that the Milky Way is a collection of many nebular star systems. Nebular star systems can be considered similar to galaxies, but maybe not always, as there are exceptions to every thing in most cases, any way.

We are of course part of the Milky Way, I suppose you could say that, but we are far out on the outer fringes of it, and we are not any where near the center of it, and we have our own galaxy we are a part of, and it is not part of the Milky Way, so technically, we are not part of the Milky Way, although we might like to think we are, since it is an expansive set of star systems, and star clusters, nebular systems, and other types of solar bodies systems, and it covers over us, and beyond us, sort of over layering us.

Be that as it may, we do not want to blow up or disintegrate the Milky Way, as we are in a way, part of it, or at least, we are encovered by it. Encover means to be covered over by something and encased within

it, or to be encircled or surrounded by it.

Retraction

Tom Selleck is not a Lesbianist but he was a Lesbianist, until the Lesbianists killed him, after expelling him from their group, and after torturing him with their many heinous torture methods.

Captain Off The Bridge.

Lay Order Of People

I have no lay order of worshippers, who participate with me, in any thing, or in any way. Why? Because, that's like me, the captain of the ship, coming into a town of persons who I don't know, and then saying that I'm the authority over them. No one is going to listen to me, and no one should be expected to listen to me. I wouldn't attempt any such thing, and so as the captain of my ship, my religious order, I have no authority over lay persons.

I have nothing to do with lay persons, what so ever. I will never have any thing to do with lay persons, unless they realize that I am GOD, and that I am the mother and father of all human beings, and all animals, and all living beings.

No one is going to recognize me as GOD, for a long time, as no one has the karma to recognize and understand that I am GOD.

Lay persons are free to do as they like, and I have no regulations concerning them, in my religious order. My children may have many regulations, for non religious order people, but I don't have any thing to do with that.

Donations For The Sake Of My Ministry

The only thing is, that, as I said before, if a person recognizes and understands that I am GOD, and that I am the Mother and Father of all human beings, all animals, and all living beings, then they are free to donate cookies to me, or clothes, or wearables, socks, and scarfs, or coats, sweaters, or slacks, neckties, and so forth, cakes, or cupcakes, baked items, or financial contributions, or chairs, and furniture, beds, linens, tables, office furniture, phones, phone lines wiring, electrical wiring, plumbing items, housing items, for building up a house, paved drive ways, mason or rock walls, surrounding the property, or a set of dormitories, or a prayer sexaling room, or a prayer ceremonialing room, or a swimming pool, sauna, bath house, toilet facilities, bathing facilities, laundering facilities, a root cellar, a molds and funguses workshop, a brewery workshop, or any workshop for helping to educate others, the land to build these things on, or money, or whatever.

If they recognize and understand that I am GOD, that is perfectly alright, to donate any types of items, or any thing of value, that would assist my ministry to get up and get running.

As yet, no one has recognized me as GOD, and no one understands that I am GOD, and the mother and father of all human beings, all animals, and all living beings, so as yet, I have not heard from one person, not a letter, or a phone call, other than an occasional wise cracker, mischief maker, or a person or person who are worried, and then complain to me, or rather, to my answering machine, most often, as I don't pick up the phone, now, as I had one person calling who was a bad kid of mine, and he was just looking for trouble, and since that, I just ignore all complaints, or wise crackers, or mischief makers,

and so on.

Nollicking Foolish People

Some people do not like me wearing my GOd cap, that is one of those specialty base ball caps, but with 'GOd' written across the front of it, and they might hate me, especially some South American or Central American Hispanic types, who have primitive and backwards religions and filled with local lore and ancient tales of demons, and goblins, and gooney bears, or ghostly ghouls, or other superstitious ideas and notions of things that go 'boo!' in the night, and try to scare or hurt people, as there are plenty of folklorish tales of such things, in primitive cultures, that thrive, even at the current time, nowadays, in large cities, even, and these types of people might want to kill me, and when they knock on my door, with their gun in their pocket, or in their hand, machete or knife behind their back, I just ignore them, and I don't even bother to get up from my work bench, i.e., my bed, to see who is knocking at the door, as I know already, they have nothing to do with my monastic order, and because they have nothing to do with my religious ministry, or with my setting up my religious ministry.

Just last night, some group of people droped by, and banged on my door, with the tip or barrel of a weapon, and it was rather hard sounding, and I just ignored them, and after a few minutes, or so, they went away, and they haven't come back, yet. I don't think they will, and even if they do, I don't think it will amount to any thing, as I may have occaisonal visitors or harrasment calls, now and then, but that's all they are, and I just won't allow my self to be bothered by them as they are unimportant, and my goof ball kids, are just too nutty to figure out that I am GOD, and that they are my kids. Nevertheless, these goof ball kids are here or there, and I get lots of compliments about my hat, and usually, if not always, the person giving me the compliment wishes to steal the hat from me, and then rob me, in any other way, he or she can, and then beat me up, if he or she can.

Well, I can't let these types of things get to me, and I just ignore them, as I walk by them, and I don't reply or return any statements to them, except a polite, 'thank you' if they gave me a compliment about my hat, but that's about all, and I might mutter something, like, and well, so that's just another one of my goof ball kids, or something to that effect.

Nollicking And Nollygaging

Nollicking means idiotic and foolish people who are wasting their time, for accomplishing nothing. It's like, nolly gaging, but nollygaging, is just wasting time, foolishly, and while you are nollygaging, you are looking for some way to make a profit, from your use of your time. Scanderously, you try to extort money from others, or force others to give you money, you do not have any right to.

That's nollygaging, as I can recall, at the moment.

Goof Ball Kids, Their Mischievousness, And Maliciousness

Well, I have all kinds of kids, and many of them are malicious, if you give them a chance, so I just stay away from all of them, as I know most every one of my children, is malicious, from time to time, if given the chance, and I think that applies to all of them, regardless of their age, at some point in their life, they will commit crimes of one kind of another, against others, and not think much about it, except that, they just had to take care of that, as they wouldn't be happy, if they hadn't.

Okay, so every one of my kids, at one time or another, will do goofey or goof ball things, and not think much about it. That's the way it is.

There is nothing to be surprised about, as every one, and I don't care who they are, every one, does things they shouldn't do.

Me, personally, I get angry, and say nasty things, and make myself sound gruff, now and then, and maybe I shouldn't, but I just feel compelled to do that, when I have a righteous conviction that some one deserves my speaking up and telling them off.

Well, you feel sorry about it, afterwards, if you hurt some one's feelings, but then that's the way it goes, and no one is perfect, so it's just. Let's try to live and let live, and live together in peace, and cut out the naughtyness, and stop the mischiefness, if we at all possibly can, and apologise if the opportunity presents itself. That's always the best way to handle things.

Most people, after they kill someone, can't appologise, and young girls and boys, and older girls and boys, think nothing of killing people, or having some one killed, for them, and then of course, there is no way for any one to appologise to the dead person, since that person is in my Epcot Center.

Well, we can't do too much about that, can we, but we can try to be kinder, and not kill as much as we feel we must to be happy.

More Than Ninety Five (95) Percent Of The Homicides In The World, Some Times As High As Ninety Eight (98) Percent, Or Even Higher, Go Unreported, And Are Therefore, Not Investigated

It's too bad that we kill others, and torture others, but that's the way my goof ball kids live in my universe, and despite what people might wish to think, to the contrary, it happens every day, in every city, town, hamlet, county, district, or where ever. My goof ball kids are killing people, right and left, and there are just so many deaths, the police don't hear the ninety five (95) percent of them, or so, as they never learn about it.

The percentage of homicides the police do not hear about, is perhaps just a little higher, but in any case, no one should be surprised, as that is how my goof ball kids get along with one and each other, and they have been getting along with one and each other, that way, for a very long time, already, so it will not stop, any time soon, and that's just the way things are, for now.

The Lesbianists are responisible for just about eighty five percent of those homicides.

Labrynthine Cities Below Us

The Lesbianists living below us, in their cavernous, labryinthine cities, that are below the hard rock layers, well below the oceans, and other bodies of water, far below the continents, go around, and mess with every one, and they play with people, and they think they have the right to amuse themselves by useing the citizens of this planet, any old way they like.

They go around, and set up phoney wars, and they watch the citizens of each country, kill each other, on their commands. The Lesbianists enjoy playing these kinds of games, and they set up civilization after civilization, and they bring it along, and help to develop it, and when they get it to a high enough level, they feel a sense of accomplishment, and then they watch and amuse themselves as they destroy what they built up, and the people who are living, unawares of them.

The Lesbianists think it is funny, that the Lesbianists feed the lies about our universe, and the lies about science, to every one, and the Lesbianists think they have the right to bafoonerize every person who comes into our world, as a tummy baby, who is on his or her way in, and in fifty to eighty or so years, is on his or her way out.

The Valderizing Lesbianists

The Lesbianists do not teach real science, or real geography, or real history, or real mathmatics, or real chemistry, or real anything, and they fool every one with their bogus religions that they either made up or corrupted, and valderized. Valderized means, they vandalized it, and sprayed grafitti all over it.

Well, that's the way the Lesbiansts get their kicks, and they are just a bunch of grown up children, valderizing every thing they can, and disrupting every thing, and every bodies' lives, just for their own amusement, and cruelish fun and games, such as feeding former Lesbianists to my abominant kids, who are need to be fed, and who are smart, and devious, and who destroy humans, and eat them up, and spit them out, and treat them terribly, while the Lesbianists watch on, in amusement, as they see people like Bill Gates, or Steve Irwin, and others, eaten up and then tortured, as I've mentioned about before.

Valderize all they may, and be cruel all they may, we are all now finally finding out about their treacherous and horrid behavior, and

now we are going to put a stop to it, permanently, and that means we will kill every one of them, and send them all to my Epcot Center, as I've explained about before.

Now we know we can cave in their cities, below the leaky hard rock layers, way down below, if we hit certain areas, hard enough, with a nice big hammer, such as one or more of my 'nuclear' bombs, the fracturable rocks kids bombs, with fuels oils, burning at extreme high temperatures, and with percussive shock forces, these, mixed together, will get my fracturable rocks kiddies, making lots of babies, and with a large enough fracturable rocks fuels chlorine, and metals that burn at high temperatures, nearing solar temperatures, we will see some very explosive 'family making' adventures, among my fracturable rocks kiddies, and their radiological relatives and friends.

We know where to hit some of their locations, to drop a few miles of more of continental shelf down onto the tops of their ceilings that will then fracture their ceilings, and cause massive damage, as oceans of water fill up their labrynthine and very well laid out cities, below us.

Who Do We Kill, First?

Mr. George Bush, Jr., Mrs. Barbara Bush, Jr., Mr. George Bush, Sr., Mrs. Barbara Bush, Sr., Mr. Ronald Reagan, Mrs. Nancy Reagan, and lots of their friends, and nearly the whole crew of politicians in Washington DC, are all Lesbianists, and I want you to kill every one of them, and send them to my Epcot Center, and I want you to place the fracturable rocks bombs, in the right locations, and then drop a thick layer of continental shelf, down onto their ceilings, their ceiling that are below the water that is between us and them, and that is below our continental shelfs that we live on.

We can hear the water down below, if we have the right types of listening devices, and if you find the right places to place your fracturable rocks bombs over, then it may be easier to drop your continental shelf, down through the water, below you, and down further onto their ceilings, the hard rock layers below the water, that is below your continent, swirling about.

Now I want you all to study this, and find the right places to drop your continental shelfs, down through the water layers below you, and onto their ceilings, so as to smash their ceilings. I've given you some hints, already, as to where you can place the fracturable rocks bombs, and my kids also have given some people more information on that, and so we have lots of people, who are interested in solving this problem of the Lesbianists toying with you, one life of yours, after the next life of yours. It is time we brought their mischief, and non sense, and cruelty to a halt, and it is time we put on the brakes, and slammed down on the brakes real hard, and at the same time, slam down on the ceilings of the Lesbianists labrynthine cavities, below you, their cities that they have laid out in perfect

symetrical, geometric shapes, like perfectly shaped, honey combed behives, with central cities, placed symetrically around the globe, in a perfect geometric layout, and with spokes or corridors reaching out symetrically, to other central cities, and to satelite cities, that they have well planned out, and have well laid out, perfectly, below you.

Hydrolific Pressures And The Labrynthine Cities Below Us

Because of the hydrolific pressures, they can never keep the ceilings, perfectly dry, and they are always in trouble, trying to fix leaks, here, there, and every where.

Now it won't take too much to bring the whole place down on them, flooding them like rats in a cage, below the water line, as a boat slowly sinks with a rats' cage on a table, with rats in it, slowly into and below the ocean waters.

The ones above, such as George Bush, Jr. the current president of the United States of America, and his wife, and his supposed family and relatives, and all his close Lesbianists' friends, should now all be killed, point blank, with your fracturable rocks bombs. I hope that is perfectly clear, and I hope you all understand what the situation is, and that it is an intolerable situation, and we are not going to allow them to toy with us, any longer, and we are not going to let them amuse themselves, any longer, and we are putting an end to their games, now.

DO YOU UNDERSTAND ME? I HOPE SO! AS A 'NO SIR!' WOULD BE UNACCEPTABLE.

Now that we know where we stand, we have nothing further to argue about, and so let's get to our tasks, as soon as we are ready, and prepared. Okay? Good.

Local Area Prayerful Collection Site

A collection site is where people gather to pray, and to sexal and to purify each other. It is not a site where people ask for offerings, or where people as for any thing else, involving money. It is a sexaling park, and a prayerful sexaling park. That is the meaning of collection site. A collection site is where people collect together, to sexal and purify themselves, and while they are at it, they make sexaling efforts to help to purify others, by shattering and showering out megawatts and tons of radiating, purifying energies.

We have a local area park, at the corner of West Tropicana Ave. and South Decature Blud., a local BLM piece of land, that some people like to camp out in, that I go out to, to bless, and to purify with my religious ceremonies, now and then.

I claimed that area, and all other BLM lands that I could claim under Gurkian Law, and all other land on this planet, that I could also claim under Gurkian Law, such as other parks and forests managed by

other government agencies, or private lands, supposedly owned by rich people, and lands around the world, that I have a right to claim, under Gurkian Law, and all that land, is now mine, under Gurkian Law, and I can use it in any way that I need to use it, regardless of what other people, think.

Aerobic Taichi Practice

I am busy, now and then, purifying that parcel of land, at the corner of West Tropicana Ave. and South Decature Blvd., with my religious ceremonies, that I conduct with my religious prayer hand signaling statements and with my use of my ability of arerobic Taichi, for religious ceremonies, as I seem to have recalled a lot of areobic Taichi, as well as some other forms of Taichi, that I knew, before, in previous lifetimes, but I am only interested in using it for practical purposes of religious hand prayer signaling.

I'm very clumsy when it comes to aerobic Taichi, but any way, I enjoy it, and it is good excercise for me, and the more I practice, the better I get, but it will be zillions of years, before I get any where near good at it. I practice the arerobic Taichi while I make my religious hand prayer signaling statements.

I don't teach Aerobic Taichi. I only use it for my prayer ceremonies, when I am on my feet, and not on my back, mostly, even though, I do use a short version form of it, while lying on my back, or, while I am on my side, I use a very short form of it. Anyway, it is fun to do Aerobic Taichi, and that makes my prayer ceremonies, for me, more fun. When other people learn to prayer signal, they will naturally pick it up, as well, as every one has studied to some extent, Aerobic Taichi, and other forms of the martial arts, and my kids will release the knowledge that is stored in your memory banks, as you need it, once you begin practicing, for women, as a priestess, or for men, as a priest.

It is not like the Taichi you see people doing in China, or Taiwan. It is Taichi, unless they are very good. It is specialized form of Taichi for use while performing hand prayer signaling. It is not used for fighting, but it is the basis for Taichi, and you can train in martial arts, while employed as either a priestess, or as a priest, and it will be useful to you to know, before hand, as it will make practicing your martial arts, that much more interesting.

I'm not hiring any one, now, or just yet, or any time, soon, as far as I know, as my kids do all the interviewing, and I have nothing to say, about who comes knocking at my door, to be interviewed.

Campers, Camping, Sexaling And Purifying The Area, And Useing The Parcel Of Land That I Publicly Claimed For My Setting Up Of My Ministry

Now, on that parcel of land, there may be campers, now and then, who want to camp there, because they want to find out more about my

religion, and so they come out to Las Vegas, now and then, and they camp out there, on that parcel of land, at the corner of West Tropicana Ave. and South Decature Blvd.

Since that land is where I am going to set up my initial ministry, when the time for that comes, I am preparing it, with my religious purification ceremonies, and there doesn't seem to be any troubles, with any one telling me not to go up to my property, that parcel of land, and there is no one trying to tell me that I can not bless my property, that parcel of land.

Now, if other people wish to come to that parcel of land, and wish to sexal on it, and thereby purify that parcel of land, they are more than welcome to come to it, with their camper trailer, or caravan bus, and they can maneuver into the area, and set up a tent, and campsite, but there is no water, or any thing else, so you have to come prepared to rough it, if you wish to come in your camper van, or caravan bus, or in a camper trailer, or with a tent, or with other types of sleeping and living gear.

Straightening And Cleaning Up The Area

You can straigten up the area, and clean it up, and make it nice, for many people to pull into, to join together, and to sexal together, and with your purifying energies from your sexaling together, you are more than welcome to stay there, as long as you like, and as long as time permits, and as long as finances permit.

I have nothing there, except for my now and again, Aerobic Taichi practice and the energies that are imbued into the area, there, from my religious hand prayer signaling ceremonies. There are no structures of any kind, and I am sometimes there, busy purifying the area, with my religious ceremonies, so if you and your friends would wish to come to that area, and also help to purify it with your sexaling energies, than you are more than welcome to come and visit there.

Donating Your Sperm, Sexaling Spittle, Perspiration, Vaginal Juices, Titty Juices, And All Your Sexaling Juices

You men and boys may by all means, donate your sperm juices, sexaling spittle, and other sexaling juices, your perspiration you generate while you are sexaling, to the site, and you women and girls may by all means, donate your vaginal juices, your titty juices, your sexaling spittle, your perspiration you generate while you are sexaling, and all of your sexaling juices to the site, as they all will help to purify the property that I intend to set up my ministry on, as they all contain many, holy, pure, sacred, powerful cleansing energies, and GODLY energies in them, and they will help purify the land, and the environment for ages and aeons to come. All of your eroteming and orgasming energies will go shooting throughout your bodies, and they will find their way throughout your bodies, and out of your bodies and brains, and into the environment, and into your

bodies' sacred and holy spillages, as I've discussed about before. Your bodies' spillages, as well as your perspiration, your pee, and your poop, not to mention all of your other juices that are produced as you sexal, erotem, orgasm, and phlumett, become pure, sacred, holy, powerfully cleansing, and GODLY, while you are sexaling, eroteming, orgasming, and phlumetting. Your pure, sacred, holy, powerfully cleansing, and GODLY energies find their way into all of your bodies' spillages, and so please donate them to the site, in appropriate manners.

Building A Latrine

Please employ some one to dig a latrine, and to fashion benches to sit on so as to be able to dump your poop, and pee your urine, into the latrine trenches. Manage the latrine, with care, and employ healthful, tactical, and sanitary techniques to use it safely. Provide hand rails, to grasp, so that no one will slip off and fall into the latrine. Provide barriers so that no one can accidentally fall into the latrine. Use your common sense when providing 'tactical' safety measures.

You need not fashion an over hang, as there is no rain to speak of, in Nevada. You do not need a supported roof, or enclosure, as they will only become stench ridden, and no one will enjoy useing them. There are to be no enclosure walls, or sides, or backs, so as to enclose the odors of the latrine, and confine them to an air tight area, where they can accumulate, and cause explosions, accidentally. They need only be deposited into a safely dug, latrine, and then allowed to filter down into the soil, and then allowed to vapor up into the atmosphere, freely.

No doors should be used, and no barrier walls should be employed, when fashioning the outside framing of the latrine facility, itself. That means, there are no hiding places in the latrine, where people can hide, and be prevented from entering, or exiting from the latrine. Only hand rails need be supplied, and only barriers that are suitable for keeping people from falling into the latrine, need by provided.

Steps may also be provided, to a raised platform latrine, which is more sanitary to use, than a level to the ground, latrine. There should be no walls, and no blind spots when either ascending up the stairs or when descending down the stairs. Women, girls, men and boys, should all use the same facility, and there is to be no fraternizing. Fraternizing is playfully tearing up at the opposition, or at people who you do not like.

Tearing up at the opposition means, you are trying to over throw the person, and dispose of that person, into the latrine. Over throwing the person means to be using reckless abandonment when dealing with another. Reckless abandonment means to be recklessly risking the life and limb of another.

There will be no frolicking at the latrine site. Frolicking is when little boys, and big boys, and little girls and big girls, play around and provide possible hazzards to others. You will not behave in a hazzardous manner towards any one, at any time, or you will be asked to leave, and to not come back.

There will be no play time allowed for children, as this is a collection site, and that means it is a holy site for holy activities, so leave brats at home, and do not bring any one who drinks alchoholic beverages, or who acts unwholesomely, to the collection site. This is a private site, and a prayerful collection site, and that means, you are coming there, to pray, and to make love, and to sexal, as GOD's children, so as to purify the site. You are not allowed to act randomly and with reckless abandoment. Randomly means, without proper self control and restraint. This is not a gay fashion, show or parade, and we will not tolerate reclusive, or unwillingly unwholesome behavior.

Reclusive means, unwilling to participate for the stated purpose of purifying the area. Reclusive means, caution and carelessness is thrown out the window, and you are acting in an irresponsible manner.

Unwillingly unwholesome means, first, unwillingly means, non cooperative, private, or sordid. Sordid means you are acting in a selfish manner, and you are not acting in a responsible manner for self and for others.

Unwillingly unwholesome means, thusly, that you are acting in a selfish manner, irresponsible manner, uncaring towards others, and unwholesomely.

Unwholesome means, you do not care about the life and limb of others, and you would just as soon shoot a person you argue with, as talk to them for a friendly chat. Many of my kids, are very unwholesome, and will just as soon, talk to a person, as shoot the person. You will not act in any such manner.

Any unsafe or prohibited latrine construction will be ticketed on detection, by me, and you will be asked to rework the facility. That will be on the ticket, and please comply, if you and your friends who built it, will be so kind. If you do not rebuild it, you will be asked, with your friends, to leave the site, as you are acting in an irresponsible manner. You will not be allowed back to the site, without your showing proper repensive behavior. Proper prepensive behavior is an attitude of appology, as well as the acts of appology which means, you will take appropriate steps to see that the work is or has been redone, in the manner as required by safety laws, as stated by my children, under Gurkian Law. Either me, or my children, will leave the ticket, and you will be required to fix what ever it is you need to fix, or you will be asked to not stay and conspiriate at the collection site.

Conspiriate means, to participate freely with caution and care for the sake of others. Conspire is also the same, as conspiriate.

You will be asked to not stay and conspire at the collection site, means, the same thing. It means, you will not be permitted to participate freely with caution and care for the sake of others. That means, you will be asked to leave, and you will not be allowed to come back, if we, my children and I, and other attendents, as well, can at all help it.

Attendents are people who participate in the collection site activities, and they are people who take responsibility to make sure every thing is done, properly, and safely, with the sake and safety of others, in mind.

The Home Depot has many nice and useful janitorial equipments, and so it will not be difficult to build a safe and luxuriously clean, and handy, latrine, that is safe to use, for all people, of all ages.

Luxuriously clean, means, it is kept sanitary.

How do you keep a latrine, sanitary? You keep it clean and sanitary by venting the air out, freely, with no blind spots, either underneath or above, where pockets of air, and vapors can accumulate.

No partitions will be installed that will create a blind spot. A blind spot is an area where light can not penetrate. Therefore, your construction materials, must be perforated wood, or grated steel. You can weld together, if you know how to weld, a very nice, grated steel, latrine, that will be safe to use, by every one, of every age. You will need the correct strength of supportive steel poles, to handle the weights of the persons accessing the latrine, and of the latrine, as well. You will make certain to build it well, and to support it well, with firm foundations, of concrete or steel plates.

Any deviation from safe practices for building latrines, will be torn down, disassembled, and the persons or person responsible will ethier be asked to leave, or will be asked to appologise to the memebers of the collection, sincerely. If the person acts in a responsible manner, and appologizes, sincerely, and appropriately, then the person will be excused, with out further, charges being leveled. Further charges will be leveled by my children, if my children detect further, reckless abandonment on the part of any person, participating and acting in a reclusive or recklessly abandoned manner.

Glue People Begun 'Cleaning' Agents

Cleaning the toilet seats of the latrine, will also help to keep the latrine luxuriously clean, and sanitary. You should clean the toilet seats and parts of the latrine, with common household detergent agents, as at this time, we have no choice but to use the unwholesome, Lesbianists' manufactured, ajax, spic and span, lysol, and other such 'glue people begun' agents. Glue people begun agents means, aerosols, and other unwholesome petrol fueled compacted or pressurized sprays,

or detergents, that help the Lesbianists to begin the process of turning human beings into glue people. Glue people, in this instance, does not refer to glue, but it refers to tar. Tar is an adhesive substance, and their intent was and is to turn every human they can find into tar people.

We have no choice but to use the local distributors selection of cleaning agents, but in time, we will one day, have all that straightened out, after we demolish the Lesbianists' hideouts, under ground, and after we kill them all, or welcome them in, as 'surrenders', with appropriate, remorseful, penentant attitudes.

Removal Of Latrine Wastes And Disposal Of Latrine Wastes

Latrine wastes materials shall be removed, and supplied to local pig farmers, who can then use the materials, for feeding the animals. Pigs and hogs love to eat away at latrine wastages, and no one knows that. Chicken also enjoy eating human wastages, as well as ducks, geese, and other fowl. Horses and burroughs also enjoy human wastages, if it is healthy enough, with large amounts of vegetable mass in the diets of the human beings, whose wastages are carried to the farms for spreading about in the hogs and pigs, barrels. A barrel is a place where wastages are loaded, up into trucks for delivery to a sewage farm, or a place where farmers can use the wastages, that the hogs are finished with, as fertilizers.

Hogs and pigs use a roped off area, for eating wastages, and employees keep track of the unloaded wastages, and the spilled wastages from the hogs, and then the spilled wastages from the hogs, are then moved to a separate area, for pickup by carriers of farmers. Foods grown at farms using hogs and pigs wastages are useful and nourishing to humans, and other animals.

No fees of any kind for loading and for carrying away wastes to hog and or also pig farmers, should be levied by truck drivers, as drivers will earn a tokenous gratitude tip from the hog and or also, pig farmer. An appropriate payment to the driver and deliverer of the human wastes to the hog and or also pig farmer, should be paid by the hog or also pig farmer, unless the farmer is cash strapped. Cash strapped hog and pig farmers may be given money compliments by the people at the collection site.

Money compliments are small awards, or minor payments, out of gratitude to the hog and pig farmer, for his or her useage of the human wastes from the latrines. Money should be collected, regularly, if hog and pig farmers are cash strapped, and then given to the hog and pig farmer, out of gratitude to him or to her, and presented, tokenously, or as a gift payment. How much should be paid, depends on the expenditures of the driver, for his or her services, and for the use of his or her, vehicle, and for its whollyfied maintenance.

Wholly fied means, the regular maintenance that will allow the truck or vehicle to run at tip top conditon or shape, for the life of the vehicle, figuring it proratively.

Proratively means, spaced out, and paid proratively, or over the period, at regularly spaced points in time, over the given span or the useful life of the truck.

Discussions regarding this, and discussions for compensations, should be held at the collection site, and at the delivery site(s) for delivery of human wastes, by all parties, concerned, regarding all of this, and the primary collection site attendants, the persons elected by the attending or participating persons, at the collection site, who show the greatest interest and sense of responsibilities, at the collection site and with regards to the collection site, and with regards to the collection sites' safe, healthy, and wholesome management, must attend the discussions, and must deliver their sound judgements as to who is to be compensated payments for their participation in the removal and distribution of the wastes from the collection site, to the hogs and pig farmers, and as to how much should be dispensed, per each removal and delivery of human wastes.

Participating persons at the collection site, should elect attendants, and the attendants should regularly check on all points for the safe management of the collection site. Participating persons means, persons who are there for sexaling, and for depositing their holy, pure, sacred, powerfully cleansing, and GODLY sexaling juices at the collection site.

Nevada Power, and all other vendors, are not participating persons, and should not be construed as participating persons, regardless of what they might wish to think, and if they have any complaints, I authorise the killing of all persons who disagree, and persist in arguing that they are valid participants, despite their not participating in your holy sexaling, activities, as individuals, and not as company employees. No company employee, or personel of any kind, may participate, except as an individual, lone, and wholeseome, participating, sexaling agent.

A sexaling agent, is a person who is participating at the collection site to assist in the purifying of the parcel of land, on which I will build my ministry, with the assistance of my children, by their participating in sexaling activities, and by their depositing of their sexaling juices upon the grounds of the parcel of land.

How To Disperse Your Juices

Sexaling outdoors will normally require that persons are naked, and juices will naturally find their way to and into the ground. Men, boys, women, and girls, all must be naked, while sexaling outdoors, except for those persons who need to be on the move, such as male attendants, who will need to go around, periodically, checking on the points of interest, to maintain the soundness and integrity of the

collection site, and of all things related to its operation and management.

Clothing

Clothes may be worn, at times while not sexaling, as particapating persons, decide.

Scarves, hats, and minor shawl like garments, Roman, Turkish, or Russian togas, or other comfortable sexaling apparel, for women and girls, to protect the dermal surfaces of the wearer of the scarve, hat, minor shawl, or other apparel, are allowed to be worn, while sexaling. We need every inch of dermal surface, bare and naked, if possible, or at least, accessible, to allow for maximum eroteming sensitivity, touching, massaging, tickling, and so forth, to heighten the erotic levels of excitement, and thrills, eroteming, orgasming, and phlumetting.

Men and boys may wear light weight garments, such as Roman, Turkish, or Russian togas, or other garments that do not interfere with access to sexaling buttholes, dicks, and so forth, for men and boys to be able to maximize their sexaling enjoyments, erotic attachments, their purposeful eroteming enjoyments, orgasming thrills, and pleasures.

Erotic Attachments

Erotic attachments refers to their titties, dicks, buttholes, mouthal holes, tounges, and other touch sensitive, eroticable and orgasmicable body parts.

Purposeful eroteming enjoyments means, their steady minded, determined, and sustained sense of attaining to the highest levels of eroteming enjoyments possible.

Leveling The Area

Some minor leveling of the area, for maximum use of the area, as an automobile and camper trailer, caravan bus, travel trailer, campsite park, will need to be done.

There are many tiny hills, and a few large ones. There is much dirt that can be removed, from the middle of the site, all the way back to the rear edge of the site.

There is a hilltop trailor park, past the edge of the rear of the parcel, and there will need to be built a very durable, and strong retaining wall, to keep that hillside, shored up, and to keep the trailor park from crashing down the hill side, after slide begins, and creep causes the trailor park to fall into the open area, that will be needed to be excavated, all the way to the rear of the park.

The grade or slope of the hill, need not be steep, but can be at a relatively low angle of ascent. An angle of between ten to twenty five, to thirty degrees, in graduations, from front to back, can be

accomplished, with little difficulty, and with no disturbment to the trailor park, or disturbment to the integrity of the trailor park.

We need not seek any permits for construction, as I do not recognize the Lesbianists' governments, on this planet, and if any person shows up who says he or she is a county or city planner, inspector, or whatever, you are to immediately kill the person, and deliver three fivers to the persons' head, as that person is a Lesbianist attempting to interfere in my religious activities.

All activities at the site are to be done, without any interference from any public or other authority, and all costs for all changes and alterations to the site are to be financed by the local construction companies, who are working on the hotels industry, and they will cease immediately their work on all construction, private housing construction, casino construction, and all other towers construction, or work construction, other than the basic infrastructure needed to support the present population of Las Vegas, Nevada.

We are taking over this town and you all will begin to prepare to vacate this town and hand over all of your construction equipment, now, or face your companies and your private persons destruction with my fracturable rocks bombs, begining with the New Orleans Hotel, and all related hotels, and casions, bars, and restaraunts. That means, every gambling establishment is to shut down, stop construction, and vacate this town, now, immediately, post haste, if you wish to live.

You will be destroyed if you refuse to follow orders. We are putting a stop to the non sense of the Lesbianists begining with Las Vegas, Nevada, Henderson, Pahrump, and all parts of Nevada and the Southwest.

You will disband your operations and hand over your companies, such as the water bureau, the power company, the gas utility company, and every other company, including all supermarkets, grocery stores, malls, and so forth, every last business in Nevada, and the south west, to the participants at the collecting site, to take over and then properly manage, until all residents of Las Vegas, remove themselves, to my kids facilities.

Is that understood? You are all resigning and moving into my kids place, underground, surrendering, and moving on for those who are not Lesbianists, but who wish to vacate this area, as this area is in whole, now, a religious grounds.

That means, that I will require the participants at the collection site to take over every thing, and to bring the news reporting stations to their knees, and force them to report the news, that every one is to retire to my kids underground, fortress, and they are all to remove them selves from Las Vegas, now, post haste, immediately, other wise, we will have a fractuable rock bombs throwing contest, to see who we destroy, first.

You must surrender all your holdings, owned property, equipments, and every thing else you call your own, and hand them over to the participants at the collection site.

Is that understood? "YES SIR!" had better be your answer, or you will find yourself on a one way ticket to my Epcot Center, with no return ticket, guaranteed, for however long it takes, to find you tummy mommies and tummy daddies.

I don't think there will be many volunteers, in the near future, as you are all abominant kids of mine, and the only kids people will ever bare, for some time to come, are abominant kids, and animals, and animal humans abominant kids, so I do not think you'll be leaveing my Epcot Center any time soon, if you resist and if you force us to kill you.

Is that understood every body? Good.

The penalty for not complying is death. Do you understand what I am saying? I hope so.

The Party Is Over In Las Vegas, And In The World

The party is now over, in Las Vegas, and at all casinos and gambling establishments, as we know you are all cheating, and we will kill every single last one of you to close you all down.

Who Is Staying And Who Is Leaving, Etc.

You will close down all of your establishments, world wide, and lock the doors on them, and then demolish them, post haste. Is that understood? I hope so. Either you do it, or we will do it. Do you understand that, now? I hope you do, because we are going to demolish every one of your establishments in this town, if you do not demolish them, yourselves. Every last one of them, all houseing, except for those noted in my children's compliance statements, which you are all to recieve, all trailor parks, with some exceptions, all every thing is to be removed, with only the basic infrastrastructure for heating, lighting, water, sewage, medical, hospitals, medical clinics, pharmacies, and so forth, food markets, services industry, HUD, Welfare, SSI, and other operations for the welfare of persons who are here, who can not leave, or who will be staying for some time, and who will be needing the services of those agences, construction companies, lighting companies, electric infrastructure installation and maintenance companies, as well as gasoline supply and distribution vendors, diesel fuels supply and distribution vendors, restaraunts, and telephone. That means, all humans are leaving, except for those person who are to stay on, as indicated in my childrens' compliance statements, and except for those who wish to stay on and participate in spilling their pure, holy, sacred, purifying juices, and those wishing to participate in purifying my area, all of Las Vegas, Nevada, the valley and beyond, in time.

Rules For Hospitals And Clinics, Etc.

There will be new rules for hospitals, and clinics, and my kids will see to it, that the new rules, are followed. There will be other rules, as well, and my kids will see to it, that they are followed, as well, or persons who wantonly disregard them, will end up in prison, underground. My kids have not only a living environment, they have prisons, as well, jail facilities, and many other things. Check with them for a fuller list, of what all they have in the way of facilities, as many are very nice, and there are great possibilities for improving your health, and rejuvenating your bodies, etc.

My kids have a full list of who is to be leaving, who is to be staying, and by when people are to be leaving, and where persons staying, are to be moving to, as we clean up this area.

All of you had better check with my kids, especially, you Lesbianists, but not only them, you religious fanatics, as well, and every one else, of course, or you, especially the Lesbianists and religious fanatics are at risk here, but not too much, the others who are to check in with my kids, risk dying, perhaps, prematurely, and then ending up in my Epcot Center.

My kids also have lists of who the people are who will be recieving all the properties for taking them over, which properties need to be demolished, who will be demolishing things, and how to remove those things that you must remove, and to where you will remove them, and dispose of them, and in what manner you will dispose of them.

You will hand over every thing, and you will all comply, and those who are required to hand over their properties, after complying with removal demands, will hand them over, and then will move out and into my kids place, in accordance with the time schedule that my children have for you to follow. You are required now to check in with my kids, get every thing sorted out, and learn all the details, and then comply.

Those who do not follow these orders risk an early and, fortunate for us, timely meeting with death, and entrance to my Epcot Center for a long stay.

Erecting A Partition Blind On West Tropicana Ave.

The roadway, West Tropicana Ave. runs east to west, and west to east, and it is advisable to erect a pertition blind, so as to not disturb traffic, that comes down the side of the road, the parcel of land sits on, at very fast speeds, with people rubbernecking to see what is going on, as many people will possibly end up flying into the area, with their automobile, truck, gravel carrier, or eighteen wheeler spinnning and turning over, out of control, and then sliding off the roadway and into the collection site.

The traffic is very fact on West Tropicana Ave., and with the interest of the local area residents, who will learn about the collection site, and the activities at the collection site, there will be many hazzards arrising as a result. Some persons may decide to stroll through the

area, to steal purses, or wallets, or cameras, and so forth, as there are many poor, indigent, or hopelessly poor, persons, in the area, who do not have any work, and who can not feed themselves, and they need to steal things, to sell, to earn a living.

Such people should be spoken to, and fed, and then warned not to act in an unrighteous manner, which means, please do not steal things, or damage the property, or any thing on it, and please do not get into fist fights, over insults, and disagreements with participants, about who is GOD, and so forth. There are many impoverished persons from South America, and Central America, who only know their local area witch doctor's teachings on voodoo men and voodoo women, and who know nothing but folklorish stories about gouls and ghosts, and people, or ghostly gouls, i.e., people immitating 'gouls', or mean and rotten people, who go 'boo!', or try to scare and rob people, in the night.

Electricity, Lighting, Etc., To Be Supplied By Nevada Power Free Of Charge, Or Else

The partition blind should be sturdy, tall, and break proof, so that vandals can not break it down, or climb over it. Lights for use at night, with the proper permissions for an electrical hookup from the Power Company, Nevada Power Company, will be granted, and provided by Nevada Power, along with all other neccessary, needed, safety lighting hookups, to illuminate the area, fully, at night, so that it looks just like, or nearly like, daylight, or a well lit soccer areana at night, or a well lit professional baseball field, or football field, at night, and it will be given for free, lest we burn down Nevada Power, and kill all of their Lesbianists employees, and meter men, and all of their tawdry workers, who we do not wish to deal with. That means, we will blow up their buildings, and kill them all, unless they give us the electricity that we require. If we need to kill them all, we will then acquire all of their holdings, and we will operate all of them, ourselves. Fair Warning has been given, and consider that as a done deal, unless you wish to visit my Epcot Center.

Meat Vendors And Hispanics From Central And South America

An air of friendlyness, but caution, should be used. Men and boys are there to protect the women and girls. So, please work in teams, and do not let individuals, who might get kidnapped, and sold off to meat vendors, for a few dollars, or pesos, as it is, in Las Vegas, as the majority of such kidnappings and sales of human beings to meat vendors, the Lesbianists chain stores, such as Colonol Sander's Kentucky Fried Chicken, Burger King, MacDonalds, Jack 'n the Box, Wendy's, In-'n-Out, Fat Burger, Taco Bell, Dell Taco, and all the other, fast foods vendors, is by the locally landed hispanics from Central and South America, who need money, to stay alive.

Erecting A Partition Along South Decature Blud.

South Decature Blvd. also has much traffic on it, and there will be lots of people, rubber necking, to see what is going on, so a high, partition wall, made of lumber, should be erected down the side of South Decature Blvd. to prevent all such incidents of rubber necking, and reckess abandonment, from occuring.

The partition should be about ten to thirty feet high, and should be well constructed. Why so high? We do not want people climbing over it, to sneak into the area, to steal things, and to fight with people, and to cause trouble, and to come looking for young girls, and young boys, and helpless, elderly folks, and uneducated to the whims and ways of the downtrodden, brutal, abominant kids of mine, walking the streets of Las Vegas.

Yes. They are abominant kids of mine, and the proof of that is that their children come out as monkey people, and orangutan people, and chimpanzee people, and if possible, the hospital whisks the baby away from its mother, and disposes of it, in the prep rooms, used for killing incoming, abominant kids of mine.

Drawings On Demolition, Construction, Etc.

My kids have construction drawings for constructing all the facilities needed at the collection site for all the facilities that will be needed. They have electrical drawings for lighting, etc., health, fitness, and wellness facilities drawings, latrine facilities drawings, showers facilities drawings, food and beverage eating and drinking areas drawings, and all other drawings related to all things that will be needed to be constructed, or altered in any way, for our project to proceed, including but not limited to, demolition of the cliffs, leveling of the entire area out to Harmon Ave. and up to Flamingo, and back to Tropicana, as well as what is to be removed and leveled between Jones and Decature. There are a few minor exceptions, such as the building that I am living in. Who will move where, to consolidate staff at this project, and who will be moving out, at this project, and what will be leveled at this project, are all detailed in the program specifications, my children have.

My present quarters, will be my place of residence, as things move along, and in time, in accordance with the schedule for construction, a temporary facility for me will be constructed near the area but between Flamingo and Tropicana, and somewhere between Jones and Decature. Please see them for details.

After the area is purified sufficiently, and after all the areas to be purified, are purified, and my children will decide on when that is accomplished, my children will then activate the technologies, and acquire the resources they need, and then they will build a more permanent settlement arrangement for all people concerned, who are staying on, if they decide to stay on.

The partical dismissive technologies and remissive technologies, for foods, and medicines, and other items that are needed, for continued

survival, and for all other required purposes according to the specifications for the sexaling for a living programs, will all be provided to the participants who wish to stay on, and houseing for them, as well, will also be included. Parks will go up, and so will many other locally needed facilities. Many things will disappear, as my kids will partical dismiss the things and structures they need to remove, as they construct the new area, for all persons staying on in Las Vegas. My kids have a list of all the names of all the persons who may, if they decide to, stay on in Las Vegas, and not all of them, are local people, so you should all check to find out whether you name is on the list or not.

All other persons, who are to be moving on, and all persons who do not wish to stay on, here, will be required to move into my childrens' present facilities, which they will continue to expand as we continue our program on this planet.

We will eventually clear every one out of the area, inside and outside of Las Vegas and the Valley, and surrounding areas, and the world over, except for the persons whose names appear on the list, as houseing can be provided above ground, for participants in the juices spilling and areas purifying operations, by my children, if those persons wish to stay on and participate.

All other people will be required to move into the facilities my children have, and are continuing to upgrade, and expand, in their encapuslated living environement, in which, many people currently live.

Persons in the encapsulated living environment, may also attend the collection site area activities, and future clearing activities, for purifying the areas with their pure, holy, powerfully cleansing, purifying, cleericating [cle-er-i-cating], and GODLY energies filled, sexaling juices.

Cleericating means, the same thing as clearifying. It is just a slightly different but related word from another a variant language of English, and to cleericate basically means the same thing as to clearify.

When we get the areas, cleared enough, and purified enough, my kids will then start building things for the participants. All others will move below ground, and live in the encapsualted living environement, until they have earned enough money, with their friends, as talked about earlier, to purchase a lease on land, and acuire the lease on resources needed, to build a home, etc., for a large group of people, who will be living together, and working together in the sexaling for a living programs, and so forth.

When Will This All Begin?

As soon as people begin to comply, we will begin our efforts to clean up Las Vegas, to begin with, and then, the rest of the world, and

then, the rest of our universe. It will take a long time, as we need to spill our juices, the lay persons, anyway, for some time, to come, as our universe is quite large, and so is the rest of it, that we are going to be recovering.

My Spilling Of My Purifying Sexaling Juices, And My Spilling Of My 'Prayer Time' Purifying Juices

I spill my juices, only for religious ceremonialing activities, during certain relgious ceremonies, and I don't spill my juices, on the properties, as I'm not set up to spill my juices, on the property, now, and will not be set up to spill juices, until I find an excuse for that, and an excuse for performing a religious hand prayer signaling ceremony that will require my spilling of my juices. It's pretty hard to spill juices, when there are no other persons working with me, and I do not work with lay persons, unless they are confirmed by me, and so there will be maybe, some confirmations, but not neccessarily so, as I do not know who is going to wish to be confirmed, and by the way, who ever it is I confirm, must realize that I am the Mother and Father of all human beings, animals, and living beings, and the Creator of my universe. There are not that many people who understand that, except for my kids, my working, unionized kids, and so it will be some time, yet, maybe a few hundred or more years, before some one realizes, 'Hey, he IS the Mother and Father of all human beings, etc., etc., etc.,"

Spilling 'Prayer Time' Spittle Generated While Praying

Until then, I'll use my spittle juices if I need to drop or drizzel any juices, that I generate while I am religious hand prayer signaling, as I don't like or care for the idea of jerking off in public, to spill purifying juices, in public, regardless of the fact, that I am GOD, so it ain't going to happen, any time soon. When I find a authentic 'believer' who realizes and understand that I am GOD, and so forth, I'll begin my public spilling of sexaling juices. I don't mind it in private, but it is not going to happen in public.

Monkey Babies, Jimmy Carter, Oliver North, And The Lesbianists' Conspiratorial Bullshit Stories Of Adam And Eve, And "Jesus Saves"

Most people do not know this, but many births end in tragic loss of the child, because Jerry Falwell, Oliver North, Jimmy Carter, Ronald Reagan, George Bush, Jr. George Bush, Sr., and the rest of them, order and expect all the Lesbianists doctors to kill all babies born to people which do not look human.

Doctors at birthing hospitals also comply, quietly, as it is hospital policy they can not break. If they go against it, they risk losing their job, and possibly losing their life. This is not a joke, and it is the Lesbianistgs policy of having all birthings in hospitals exactly for this reason, for disposing of non human looking babies, at birth, so that their bullshit creation by God, of a 'pair' of people,

Adam and Eve, and that "Jesus Saves all good Christians", can not be contested, by logical proof of non human births to human being couples, or single parent women or girls.

Abominant kids are born every day to my kids, on this planet, and they are all executed, or killed off by the local citizens, by their fright and fear of 'ghouls and ghosts' and 'goblins' in the night that go, 'Boo!'. These idiots, both the abominant South Americans, Central Americana, and all my other abominant kids, North American, Europeans, Russians, Chinese, Japanese, Thai, Philipine, and so on, must ask them selves why they are blessed with babies which are either not human or are abominant humans, or part animal humans.

If they ask them selves these questions, they will find out the only answers are that these people born to them, are my children, and my children are born to them for reasons that have not been disclosed to them, before, by the clergical societies, i.e, the religions of the world, and by the other societies, set up by the Lesbianists, or by societies nurtured along as part of the Lesbianists' 'tragic comedy' of their toying with your lives for their humoring themselves, and for their amusing themselves.

Once we get rid of the Lesbianists, and their ways of doing things, we will begin to see babies that are either not human, or are only part human, in animal bodies, and they will be born to all of you who are tummy mommies, and tummy daddies, if you birth enough children, to find out. How many is enough? About one in forty or fifty by my estimation, but depending on the person, it may be between thirty to eighty, from one person to the next.

Take that to our pastor, and tell him or her, to stick it up his or her ass. It is the truth that animals are born to humans, all the time. Not only that, but abominant kids of mine, usually of the apey kind, but not always, are born to the 'normal' looking humans on our planet, and in our universe.

We need not be afraid of these children, as animals, can be collected and put into zoos, and animal humans can be raised by the parents, or parent, in the case of a single parent.

In time, we will adjust to this reality, and we will raise fine children, abominant animal humans, or human appearing abominant children. That means you are all abominants, and the Lesbianists are laughing at you, and at themselves as well, as they go around and kill and cravenly torture every possible person they can.

We will put an end to their craven ways, and we will make a wonderful universe for all of us to live in, in peace, and serenity, once we get started practicing my religion, and once we begin erasing, sufficiently, our karma and our karmic markups, with your purifying sexaling energies, prayers, and other activities, such as syncopated dance, syncopated excercise, syncopated sexaling, and so forth. You

time it to the metronome at one thirty seventh, for now, and that will be fine. In time, we will get accurate metronomes, and then we will chance the pace, just ever so slightly, to push my kids along, as I explained about, for our wholesome and healthy universe, for all of us to live in, together with each other.

Punishment For People Who Practice Voodoo Religions Is Dismendment, I.E., Death

We will not be killing or executing children any more, at hospitals, or at homes, or in primitive, backwards towns and villages, or rural hideaway villages, where voodoo religions muster the people into peculiar states of mind, where they become entranced, and then begin mindlessly, acting like chickens, and birds, or fowls, or hippos, and so forth. There are too many of these types of so-called 'religions' in this world, and we are out lawing all of them, and punishment for adhering to them, will be a trip to my Epcot Center, as I have my children particle dismiss their bodies, and then dismend them, bit by bit, into their base components, and then have my children whisk them into my Epcot Center.

We will bring every one up to the level of education every one needs to be at, to better understand my universe, and those who persist in abandoning their obligations, will be dismended with out further notice, after they are sent their last warning ticket, from my kids, in accordance with Gurkian Law. That also applies to the Lesbianists, and to every one else, who is unable to get the picture here, and get with the program. There will be no exceptions. And, this is not a joke.

My kids have courses for you to educate your self in, to pull yourself out of the past Lesbianists' way of life and thinking, and into the new and current, reality, that we will be living in, for ever, from now on.

Local Businesses Will Have No Problems At All With The Collection Site And Will Have No Problems At All With The Activities Of The Faithful At The Collection Site

Walgreen's is across the street, on one corner, and Home Depot is on another corner. I don't think Walgreen's will have any problem with you using the site for your camping, for your meeting with others, for your sexaling with others, and for you and your friends' purifying sexaling activities in that park, i.e., the collection site.

Home Depot, I don't think will have any problem with your use of the parcel of land, either, for those purposes.

What To Do If The Police Come?

Now, if the police come, and I'm there or not, I don't know what they'll say, but they have not got any right to say any thing to any one. Is that clear, Mr. Mayor of Las Vegas, and every one else in the

area. I hope it is, as I am not going to stand for your interference or any one else's interference in my religion and in the relgious activities of people who wish to participate in my religion, sexaling to purify my universe. IS THAT UNDERSTOOD, MR. MAYOR AND EVERY BODY ELSE? I HOPE IT IS! AS A 'NO SIR' WOULD BE UNACCEPTABLE!

Now that we have an understanding, I think there will be no problems, and if there are, I will see what I can do about it, by calling my kids up, with my religious hand prayer signaling ceremonies, to see what they can do for you, to help you out, and to break the backs on law enforcement officers, and the Mayor of Las Vegas, and every other person, Lesbianist or not, who tries to interfere with me, or who tries to interfere with the people practicing my religion.

I will not stand for any interference from any one, including Mr. George Bush, Jr., the current president of the United States, or any one else, such as the Mayor of Las Vegas, or the Governor of Nevada, or the Nevada Highway Patrol, or the Nevada Sherrifs Dept. or the Las Vegas Metro Dept. or with any other persons or parties, such as the Las Vegas Gaming Commission, or any other Lesbianists' or Lesbianistic organization set up by the Lesbianists, and that means all you church goers, parochial school teachers, and students, and others, and if any one interferes with any one who comes to my ministry's claimed parcel of land that I am purifying for setting up my ministry, and if any one hassels any one there, than who ever is visiting the collection site, to help to purify it, you have my permission to kill the persons attempting to interfere in any way at all, on sight, with what ever you have to kill them with. Please dispose of their bodies in the nearest trash dumpster.

DO YOU HEAR ME? MR. MAYOR. YOU ARE A DEAD MAN IF YOU EVEN TRY TO SEE WHAT MY RELIGIOUS FAITHFUL ARE DOING, AND SO IS EVERY OTHER PERSON ON EVERY SCHOOL BOARD AND CHURCH OR OTHER LESBIANISTS' COMMITTEE. IS THAT CLEAR, EVERY BODY? GOOD!

You will not interfere with my religion, and with my religious faithful, and they will come to Nevada, and they will come to Las Vegas, and they will start sexaling on that property as they see fit. Does every body understand that? I hope so.

Now. Non responsive persons, who ignore my statements, will find themselves in trash cans, and trash dumpsters, every where in Las Vegas, and any where else, where there is a convenient trash can or trash dumpster. There are lots of them around, and people are throwing dead people into them, every day, across the country and around the world, and they all end up in landfill sites, and so there will be no added charges for our using the statewide Nevada Silver State trash retainers and containers, for however many others who need to be killed, and for my religious faithful to then place them into the trash cans and trash dumpsters.

No charges should be levied by any other Lesbianists' trash collection company, around the world, as they are all owned and operated by the Lesbianists, and we will not support them, in any way, what so ever.

If Mr. Mayor would like to be the first guest inside of one of the Nevada Silver State trash dumpsters, then he will try to interfere, in person, and he will be shot, point blank, in the center of his head.

You will then kill him with three fivers, to make certain he is on his way to my Epcot Center, for his next trip out as a tummy baby. If the Governor of Nevada wishes to interfere, then he does so at the risk of being shot, killed, and made certain he is dead, with three fivers, and then after that, he will be deposited into a local or state trash dumpster, either here, in Nevada, or in California, or Arizona, or where ever it is convenient to dump him into a trash can, trash container, or trash dumpster.

Lesbianists Enjoy Eating People, Who Are Alive, As Well As Eating The Bodies Of Those Who Are Dead

You should let the state's vice mayor of Las Vegas's office know, who was shot, killed, and confirmed dead, after depositing three fivers into his or her head, and then where the body is, and generally when the body was dumped, so that they can get an idea of how decomposed the body is, and whether or not the body is in a land fill site. They can then check on it, and verify that the body will make it to the land fill site, if it isn't already, there, where all the other bodies, are ending up, unless they have already happened to have beeb eaten up by the Mayor, or by the friggen Governor, or by the Sherrif, or by another Lesbianist.

All persons are free to travel to Las Vegas, and they are invited to stay at the parcel of land that I described, and they are invited to make it into a nice camper trailer area for recreational vehicles, or for what ever other types of outdoors camping vehicles, travel trailers, caravan buses, or any other types of camp site temporary stay, housing and living arrangements you would like to use the area for.

Every Game Of Chance, Gambling Machine, Or Slot Machine Is Rigged, In Every Casino Around The World, With Only A Few Exceptions

If you will all sexal, regularly, to the best of your abilities, and help me to purify the area with your sexaling, undisturbed by any one, and clean it up with your purifying energies, you are more than welcomed to come and enjoy the area, and see what fine attractions, will be leaving Las Vegas, in the not so distant future, including the gaming commission, with all their phoney, rigged gaming systems, that the Lesbianists control.

The Lesbianists' Articles Of Participation

The Lesbianists have every game that you can possibly rig, controlled by electronics devices, or by slight of hand, mechanics, who control

the gaming rooms, and gaming halls, so that only Lesbianists win any money, that is worth mentioning about, and so that the Gaming Authorities, and the Mayor's office, and every other Lesbianist organization in Nevada, who has any one in their office, can then go and get the money the Lesbianist won, and get a percentage of it, given back to them, as they have arranged to do that, as that is part of their oath, and part of their sworn promises to do, as that is written out in their articles of participation, their rules for living upsite, not down below, in the labrynthine cities, and every Lesbianist must follow those rules, and when they win the Megabucks, and every Lottery in the world, they must give back money to the Lesbianists, as every game of chance that is run in this world, except for bingo, is rigged. However, even Bingo is rigged, in some ways, by people switching cards that look like winning cards, while players are not looking, and by other naughty tricks.

Every Lottery In The World Is Rigged

Every lottery in the world, performs the drawing out of the balls before a live audience, in most cases, before they actually air the show, and they have illusionary tricks they play, with the technologies they have, and they sucker people out of their money, daily, around the world. Las Vegas is no different, and they sucker every one out of their money, except for the Lesbianists, and they let some people, win now and then, small jackpots, on the gaming machines, and then after a winning streak, they set the machines the person uses, so that the person can not win a dime. They have the technologies for rigging every machine in Nevada, and across the country and around the world, so next time you visit one of their casinos, be sure and detonate one of our bombs, you can make, and destroy that casino. Is that understood? I hope so, as every day, millions of people are being suckered out of their hard earned money, they pay taxes on, through the nose, till they are practically choking, and the Lesbianists take it, and support their folley and games. They also support their folley and games with your revenues, that they make sure you lose, at every casion, and at every gas station, with a convience store, that has gambling machines in it, for you to deposit you money into.

Every lottery in the world is rigged, and so if you spend money on it, if you are not a Lesbianist, you are just throwing your money away.

No Fair Play In Nevada, And No Fair Play In The World

There is no fair play, here in Nevada, or any where else, in the world, and I would like you all to know that, and become aware of that, and then I hope you will tell your friends about it, and then I hope you will destroy every single last one of their casinos, and gaming machines.

We are not going to allow them to continue their frolicking at your expense, and we are going to destroy every last one of the

Lesbianists, as soon as we can.

If they prefer to surrender themselves to my kids, than we can allow them to live. However, if they do not surrender themselves to my kids, then we will kill them all. And there are no 'maybe's' about that.

Sniper Shooting, And Miscellaneous Information

You have my permission to sniper shoot any police officer, park ranger, sherrif, or other person, plain clothesed police officer or detective, with or without a gun, on sight with your scoped rifles, and targeting assistant who will determine range, from your bunkered in the hillside, shooting site.

Any hotel in the area, which might harbor shooters from local police, sherrif, or SWAT team operations groups, you have my permissions, and blessing, or go ahead, and my 'okay, and 'approved for action' sight of appeal.

Sight of appeal means, my blessings, based on your determination as per your good judgement.

One hotel that is clearly the most convenient, and the closest with in shooting range, at close range, is the New Orleans Hotel. Hotels within shooting range, at a distance, are the Palm's Hotel, The Rio Hotel and Casino and its seperate tower wing, and a few others, off in the distance. You'll have to come and look at them from the approximate location of the site after you determine where every thing is, to locate and determine for your self which hotels and towers need to come down, and what you will need to bring them down.

There is a tower off in the distance, a new hotel, that is going up, that I do not know the name of, but is clearly within shooting range, and needs to come down, and people are on it, daily, welding, and you can't miss it, if you look in the north easterly direction from the site.

There is the Stratosphere Hotel and Casino, which also needs to come down, which is further over to the west from the new hotel wing that is going up. There are many scaffoldings in the area, that also need to come down with explosives, fracturables rocks, fuels, chlorine, and high temperature minerals particles ignition, and particles burnings bombs.

There are probably a number of other landmarks, hotels, casinos, bars, restaraunts, trailor parks, trailors, houses, apartments, condominiums, near or off in the distance, that also need to come down, and need to be demolished with my light weight explosives fuels, gunpowders, metals particles, and chlorine plastique explosives bombs.

You will destroy them all, and you will come prepared, or be prepared to acquire all the demolitions needed to destroy them all, as well as to destroy all the local police and sheriff's many Metro offices, SWAT

Teams offices and units, Fire and Rescue Ambulance units, Lesbianists' Hospitals, and other Lesbianists facilities, throughout the Las Vegas Valley, Henderson Nevada, North Las Vegas, Pahrump, Mesquite and the whole Southern Nevada, westward to San Diego, California, northward to Los Angeles, northward to San Francisco, California, northward to Berkely, California to Oregon, and Washington State, and back down to Reno Nevada, Arizona, New Mexico, Albequerque, Houston Texas, Dallas Fort Worth Texas, and all areas where there are tactical SWAT team units, military units, militia units, as all militias are organized and operated by Lesbianists, despite popular beliefs that they are independent of the government, and anti government, as we often see on the "TV for the Brainless", as they are often refered to, i.e., the general public.

You will destroy all law enforcement offices, and personel, and all military and militias. All governments, their offices, and employees, are to be destroyed, and all personel are to be executed, except for those who take it upon themselves to execute the Lesbianists among them.

My kids have a full list of all the places and structures that need to be destroyed, and demolished, and so please see them for that information.

And to repeat, your orders are to kill the president of the United States, George Walker Bush, Jr. and all of his and his wifes' Lesbianists' associates, pretend relatives, and friends.

We are not going to let this stand, another moment, and if they do not surrender to my kids, you are to execute them all. My kids have a list of names, of those, who have not surrendered, as yet. Please see them for and ask them for that list of names of persons who have not as yet, surrendered, and who need to be executed, post haste, immediately, or, ASAP.

United States President George Walker Bush, Jr., is no exception to this, as he has not surrendered, as of yet, and that is confirmed. Neither has any of his colleages, or congressional office holders and diet or congress members, except for Ted Kennedy, and one or so others, and maybe a cabinet member, one or there abouts, but I haven't confirmed that, yet. There are some members of the congress who are not Lesbianists, and you can get their names, on a list from my kids, as well.

Captain Off The Bridge.

Texas's Lesbianists' Latest 'Vaccine' And Texas's Attempts To Destroy Women's And Girls' Vaginal Lining And To Destroy Women's And Girls' Cervical Lining, Causeing Stillbirths To Increase, So As To Prevent The Successful Birthing Of Children - Latest Lesbianists' Vaccine Will Cause Numerous Problems - Execute United States Of America, State Of Texas, Governor Perry And Family - Underground Books Distributor's For Militia Types Folks - Information On Bombs Making And Detonators On The Web - Solar Flares And Flare Igniters - The Lesbianists' Balooney On Minus Charges As Opposed To Positive Charges - The Lesbianists' Maps Of The Brains - Execute The Current President Of The United States Of America, George Walker Bush, Jr. - Lesbianists Who Decide To Sexal In My Religion With Lesbianists And Non-Lesbianists' Persons - Citizens By Proxy - Temporary Full Time Citizens - What To Do About Untimely Pregnancies, Health Issues, Medicines, And Regroverative Formulas - Medical And Housing Benefits, And Other Health And Work Related Benefits - When Can People Begin To Come So As To Be Able To Participate? - Sniper Points, Places Where Snipers Shoot From - Pocket Knives, Construction Tools, And Miscellaneous Daily Life Management Tools And Equipment - Hookups For Travel Camping Vans And Similar Vehicles - Cleaning Up The Area And Throwing Away The Garbage - Schedule For Leveling Of The Ground And Hills In The Area, Removal Of Unsightly And Smelly Garbage - Setting Up New Facilities - Fountains And Showering Lamponeers - Restaraunts, Clubs, Lounges, Eateries, Cafeterias, Bars, Pubs, Bicyle Paths, And So Forth - Dealing With Criminally Minded Persons - Alterations, Modifications, Changes, Clearing Up And Removal Of Garbage In The Areas, And Additions Time Schedules Updated: 12-02-07 Rev.a.00.a 02:30 PST

Texas's Lesbianists' Latest 'Vaccine' And Texas's Attempts To Destroy Women's And Girls Vaginal Lining And To Destroy Cervical Lining, Causeing Stillbirths To Increase, And To Prevent The Successful Birthing Of Children

The latest attempt by the Lesbianists' governments of the world, near by my computer window, on the internet news services, to destroy and toy with the human population of this planet, has been launched in Texas, and is targeted at women and girls, and their ability to have children.

See the article at the end of this post.

The new vaccine, which is mandated by Governor Rick Perry, who signed it into law, and is now obligatory, unless you protest it, and go to

court, and spend years fighting it, as an individual or small group of claimants, will destroy the vaginal cervical collar and the lining that holds every thing in place, and supports the interior of the vagina, thus making it impossible to carry a fetus to term. The vaccine is also targeting the brains fibers throughout the human body, and the fibers of the brains in a woman's or girls' body will slowly rot, and decay as they are eaten up by tiny animals that eat these energies conducing fibers, synapses, relay switches, and other related energical brainal related things and dings thoughout the body.

Latest Lesbianists' Vaccine Will Cause Numerous Problems

It will also speed up the eating away of the enamel of the teeth, and of the bones in the woman's and girl's body, her fingernails, and her skin membranes NS membraneous tissues throughout the body, and on the exterior of a woman's and girls' body, making the women and girls grow older looking at ever more younger ages, and making women and girls susceptable to skin cancer, melanoma, herpes, genital warts, other infestations of animals in the skin, and other skin related membrane destructing colonies of animals, that they use from out of their Bio Chem War encyclopedia of how to destroy human beings, with poisonous and health problems causeing crystals cages animals of all kinds. Especially numerous are the Bio Chem Warfare crystals cages animals of the petroleum industry's based kind.

The vaccine is no different from any other of the Lesbianists vaccines aimed at destroying the health of the people who live on this planet. It is compared to the 'polio' vaccine, in the news article, and that was similarly an attempt at destroying the health of the human being, by making the human being incapable of haveing any sexual orgasming capabilities, by killing off all the sex related animals and bugies in the body, which make sexaling juices, that make eroteming and orgasming possible.

Thus, this latest attempt at destroying the health of the people who live on this planet, locally, in Texas, and that I know of, anyway, is nothing more than the Lesbianists toying with the people who they are here to amuse them selves with by destroying them, little by little, over a long period of time.

Execute United States Of America, State Of Texas, Governor Perry And Family

This will not stand, and you will all destroy the capital of Texas, and Governor Perry's mansion, and the Governor and his wife, and their family, pretend or otherwise with my fracturable rocks and fuels chlorine and explosives, etc., bombs, that you will make in your home's garage, or workshop, safely.

Underground Books Distributor's For Militia Types Folks

Use the delayed timer invention, that is a workable time delay detonator, that I've explained about, especially if you use black

powder gun powder, mixed with axel grease, turpentine, benzine, chlorine, using also some Elmer's glue, prior to mixing with chlorine, and then set it in a warm cupboard, to ferment for a few days, to then turn into a nice plastic explosives mixture for detonating with the string of flash bulbs wired to the alarm clock trick, as described by Ragnar or by one of the other bombs making specialists, in their sub culture literature for militia types folks, who wish to destroy the government.

They find the list of names of all the people who request the literature, by mail, and then they go and watch them, with their surveilance technologies they have, and then they either capture and torture them, and then kill them, or they just make sure they are die, in a fatal car accident, or whatever.

Paladium Press is one of the Lesbianists' book publishers, and there are others, and this one is affiliated with the National Rifle Association, a Lesbianists organization.

This publisher has titles sold to underground books distributors, and you can find a number of underground book distributors on the internet, which carry more titles than Palladium press.

Delta Press, who publishes their books and paraphenalia distribution listings magazine, 'Delta Force' is one of these distributors of interesting underground literature.

http://www.deltaforce.com/catalog/page30dp.html

'Home Made Fireworks', is one web page to look at, if you have the time.

http://www.deltaforce.com/catalog/page28dp.html

'Booby Traps, Explosives and Black Medicine', is another useful page to look at, as well.

http://www.deltaforce.com/catalog/page30dp.html

There are a number of other distributors of underground literature, and some have better selections than does Delta Press.

In any case, with a little research, there are plenty of 'timed detonation devices' drawings, and explanations, for you to view, and learn from, that will help you to construct a timed detonator, that will allow you to safely set off one of your plastiques bombs made with my explosives formulas.

Paladin Press, you can find their books at Amazon Books on the web, another Lesbianists owned corporation, is another publisher of interesting underground literature, that can be useful for you to study and learn from.

Paladin Press can be found at, http://www.paladin-press.com/

Books for supposed 'Professionals' who are anti terrorists professionals, that allow them to detect the different types of bombs people can make, and then use to destroy others, is sort of a tounge in cheek joke of the Lesbianists, for luring in people who wish to find information on bombs and explosives.

There are many useful books published to help beginners understand the basics of bomb making. The idea is to use the information for professionals who wish to understand the craft of making bombs, and detonating devices, and then use that information to build your bombs and your detonating devices.

The flash bulbs wired to an alarm clock with matches and ignitable phosphates glued to a string of flashbulbs, wired properly together, then crushed, so as to expose their flash and heat ignition coils filaments, for your detonating heat energies ignition needs, is one of the basics and you can find it in one or another of the underground books on bombs making and detonation devices making for 'professional' anti terrorist's private investigator or bombs detection professionals types.

This is one of the ways the Lesbianists lure in persons who know nothing about weapons, and then they find out who they are, and then they make friends with them, and toy with them, and introduce them to their Lesbianists' friends, and hang out with them, and pretend they are all friends, then one day, they all attack the person, and torture the individual, and get their kicks, amusing them selves, by ripping the person up, or by hanging, and nailing the person to a wall, with a nail gun using, approximately, three inch nails, and then hammering in longer, seven inch to twelve inch nails, or larger ones, or other similar nonsensical, childish, but fiendish behavior.

The "BRUTAL ART OF RIPPING, POKING & PRESSING VITAL TARGETS"
"by Loren W. Christensen"
http://www.paladin-press.com/detail.aspx?ID=1441

Is a beginners guide to ripping people apart, one arm, or leg, at a time, or with team work, one half of a person can be ripped from the other half, if you hold the right bones in place, and then, using teamwork, rip the person into two or more pieces. This book gives a person a preliminary sense of what he or she can muster, as an individual who attempts to rip at a person, and tear the person apart, one limb at a time, or with friends, how to rip a person up, one piece or more, at a time. Ripping people up is accomplished best, if they are unconcious. If they can not fight back, or resist, it is easy to rip a person apart, if you have the needed strength. Since many people have ancestors who were monkeys, chimps, orangutangs, guerillas, and so forth, with tremendous muscles strength, there are lots of very tiny persons, with phenomenal strength, and they can easily rip a person in two, by them self, if they try.

Books on booby traps for law enforcement personel, are simple descriptions of bombs that they may or may not encounter, and there

may be some useful information in some of them such as,

"BOOBY TRAP IDENTIFICATION AND RESPONSE GUIDE FOR LAW ENFORCEMENT PERSONNEL"
"by Tony L. Jones"
"This manual teaches cops and other law enforcement personnel all they need to know to recognize a booby trap and respond properly. Find out where booby traps are most commonly employed; the 11 physical signs that most often signal a trap; what to do (andnot do) if a trap is suspected or found; how to safely search a building, outdoor site or vehicle; and the one indicator that practically guarantees that a building has been booby-trapped. Shows more than 90 different booby traps in place. For academic study only. 5 1/2 x 8 1/2, softcover, photos, 80 pp."

There are others, which you can also find, that will provide schematics, and drawings of useable ambush related devices, and detonators for them.

"Contingency Cannibalism", sold through Paladin Press, and other 'underground' book distributors, is one of the Lesbianists' favorite books, that help them to track persons who they would like to later, cannibalize, themselves, as a joke on the person.

"CONTINGENCY CANNIBALISM"
"Superhardcore Survivalisms Dirty Little Secret"
"by Shiguro Takada"
"This twisted, tongue-in-cheek look at cannibalism as a last-resort survival option analyzes real-life case studies and historical episodes of cannibalism. Then it examines the hard-core decisions and gruesome details one must know in order to partake in this grisly practice. Recipes included. For entertainment purposes only. 5 1/2 x 8 1/2, softcover, 160 pp."

The Rusksack, "Survival Information Clearinghouse", is just one club of members of mainly Lesbianists, who have fun toying with the people who live on this planet.

http://therucksack.tripod.com/survival.htm

Information On Bombs Making And Detonators On The Web

For information on making detonators, and other bomb related stuff, please see this web page as it costs nothing.

http://www.bombshock.com/archive/Homemade_Bombs/

Solar Flares And Flare Igniters

A solar igniter as talked about in the article on page,

http://www.bombshock.com/file9/crtrmkr.txt-Crater_Makers-932.htm

'Crater Makers', is a solar flare igniter, a device that is used in solar flares, or night time distress signal flares, that ignite the flare, by sending an electric battery current into the flare phosphates holding tube, down a wire, on an ignition circuit, and then igniting the distress signal flare.

You can find solar igniters inside of distress signal flares that are used on boats, for shooting up into the air, with a flare gun for maritime use, that will send the distress signal flare up into the sky, if you have the flare gun pointing in that direction, and then at a certain altitude, a trip switch circuit is activated, due to air pressure, or due to timing from time of departure of the distress signal flare from the flare gun barrel.

You have to exhibit extreme caution, when taking a flare apart, as it can detonate, accidentally, and they are not made in a way so that people can safely take them apart, and people who try to take them apart, are accidentally injured, on a regular basis. Do not use this, if you do not know any thing about demining, as a professional mine deactivating specialist in the military, or with military training. This is best left up to the professionals, and is not meant as something the average house wife, business man or business woman, or chemistry or other studies, school student, should attempt.

You can use a flash bulb, and get the same results, if you glue some gun powder and phosphates to the flash bulb housing, and then crush the glass, and then wire it properly to a common house morning wake me up, alarm clock with a striker bell and a striker that moves back and forth. The circuit is simple, and you can figure it out with little difficulty.

The Lesbianists' Balooney On Minus Charges As Opposed To Positive Charges

Remember the minus sign on a battery is where all the activity of the little energies kids is going on, and the Lesbianists purposefully teach that the positive side is where the current is moving out of, and around towards the negative side of the battery. The Lesbianists teach that the active side of the battery is the plus or positive side, or the side with the plus sign on it, when you look at a common house hold nine volt battery, and that the non-active side is the negative side, or the side of the battery with a minus sign. This is false. The side with the minus sign on it, is the active side, and that is where you do not want to wire any thing to, unless you know what you are doing. The positive side has no activity going on, and is safe to touch, but the other side is not safe to touch, and the testing meters are wired to show you that the reverse is true. They have tampered with the design of testing meters, so as to support their allegation and falseity, that the minus side is where there is no activity, contrary to the truth.

That means, that, the flash bulb igniter system and the flash bulb itself should indicate that one side is the positive side, for the

positive wire to be attached to. You had better check carefully, and make sure there is no mischief here, as you do not want to detonate your igniter, accidentally. Ask a qualified electronics specialist to do all your wiring of your detonators, as he or she is the only person qualified to wire these types of detonators.

The Lesbianists' Maps Of The Brains

It's rather confusing, the way the Lesbianists have reversed things, and have messed around, so as to thwart your attempts to make nice detonators that work every time, unless you have a normal set of brains, which unfortunately, I have not got a pair of, or triple set, or more of. That's sort of a joke. On a magazine, yesterday, I saw how the Lesbianists teach that one part of the brain is for speech, and one area of the brain is for speaking, and one area of the brain is for sight, and one area of the brain is for logical thinking, and one area of the brain is for signing, or one area of the brain is for artistic inventioning, and so forth, but that's a lot of hog wash.

The brain is not partitioned in that way, and they know it, and they are misleading every one, and laughing at all of you while they are doing it, with their 15th to 17th century style drawings, that they have plastered on all the Time magazines, or what ever magazine cover it was on, that I saw in the check out lane, at the super market, yesterday. You have kazillions, and more of parts to your brains, and there are so many, it is unlimited, nearly, and your brains are so complex, and you have got brains in lots of other places in your bodies, other than in your head, and I'm not going to go into that one, now, but the Lesbianists are lying through their teeth, when it comes to this type of pseudo historically backwards, archaic, or cave dwelling human's notions on science, that should insult a first grader, or kindergarden school student, or preschool student.

In any case, ask your local electronics' specialist or house hold electricians' specialist, or handy man repair persons, who work for house hold water heating devices installation companies, or other electrical home appliances sales and installation companies, who also get confused, from time to time, as I've witnessed them, personally, blow up breaker circuits.

Get a qualified, and that's hard to find in so far as I've witnessed them at work, electronics' specialist to wire your detonators, or go take a course with my kids, as they have courses available on wireing such devices.

There is no minus charge, and there is no positive charge, and that is what you should understand. There is a side to the battery where there is lots of activities going on, and that is the minus sign side on the battery. The positive sign side on the battery is where there is little to very little or nearly no activity, but no activity is not the truth, either, as there is activity, you just can not measure it with todays' electronics measuring devices, as they are not

technologically sophisticated enough to be able to detect the activity, though I'm sure there have been intrepid scientists who discovered that both sides of the battery have activity, and then they were shot and killed, after that discovery, by a Lesbianist assasin, or by a hired assasin, assigned or paid to kill the scientist who discovered that there is activity at the 'minus' side of the battery as well as at the 'positive' side.

That means, that you need only concern your self with the 'minus' side, since you will not be able to detect any thing at the positive side, unless you use the reverse wired electronics and electrical energies detection devices that the Lesbianists market through Tandy, or Radio Shack, and at Sears, and so forth.

It gets confusing, a little bit, doesn't it. Anyway, go and take a course at one of my kids classes, after you sign in, and swear in as a jr. member to our new country, which I haven't sworn on to, as yet, or joined - but though I am the boss of, regardless - since my kids do not speak to me, on a daily, or weekly, or other basis, and I just happen to be able to know what they are doing as they tell me what they are doing, through some secret port hole in one of my brains some where, in my toes, or nose, or who knows where, as they telegraph or some how signal in, using semiphore signaling, or probably hand signaling, that my brain then catches, and then passes on to me, their messages that they signal in to me, and the news, as well, about what they are doing, and about what is going on with them, and about what is going on with some other things, as well.

Since I am GOD, I happen to have a right to know this stuff, what they and every body else is doing, on a daily basis, but they haven't told me how my brains catch their information, yet, or the other information that gets there, some where into my one or more of my brains, and I haven't figured it out, yet, myself, either, though I think I know something, a very little something, about how it works.

This does not mean, that my brains are unreliable - except for my memories areas of my brains, in particular - but that I am just waking up to what is going on, here, and I have a few kazillions of years to work out every thing, or some of the basics, any way.

In any case, you have all been snookered by them, with regards to their non sense sciences, and you are being laughed at, and toyed with, daily by them. That happens to be the truth, whether we find it pleasant or not.

Execute The Current President Of The United States Of America, George Walker Bush, Jr.

In any case, the Lesbianists are a twisted group of individuals, who toy with the people who live on this planet. Mrs. Hillary Clinton, Bill Clinton, George Walker Bush, Jr. President of the United States, his wife, Barbara Bush Jr., George Bush, Sr., former president, and

his wife, Barbara Bush, Sr, are all gagsters, or jokesters, who wish to only toy with you, and eat you, or deprive you of your life, and of your rights, in fiendish and horribalistic ways and manners.

They are all to be executed, especially George Walker Bush, Jr., President of the United States of America, currently residing at 1600 Pennsylvania Ave. Washington DC, in what they call the White House. You are to kill them all, and send every last one of them to my Epcot Center, as soon as is convenient for you.

Lesbianists Who Decide To Sexal In My Religion With Lesbianists And Non-Lesbianists' Persons

If any Lesbianists decide to sexal in my religion, with their friends, and their friends may include other Lesbianists who decide to sexal, as well, as well as, other people they know, then they may begin sexaling with their friends in my religion, however, they must have a pentative attitude, and they must say they are sorry, and they must now and then, when they feel they wish to, and feel emotionally and mentally capable of speaking about it, they can talk with their friends who they are sexaling with, and with others who wish to listen as well, and they can denounce the Lesbianists by telling people about the things the Lesbianists do, and did.

If they decide to do this, this is the same as surrendering, and my kids will protect them from other Lesbianists who might want to harm them. They have not sworn in, as a citizen of my and my kids' country, and as citizens of our country that every one is swearing in to as citizens, but it is sort of a promise to swear in, informal gesture that they are committed to, once they begin sexaling with their friends, and with other Lesbianists, who also wish to sexal and in time, denounce the Lesbianists with them.

Citizens By Proxy

By denouncing the Lesbianists organization, and by telling people about what the Lesbianists do and did, they are essentially stating they are sorry for what has happened, and that is a pentative attitude, and with that pentative attitude, they are accepted as citizens, by proxy.

Temporary Full Time Citizens

Citizens by proxy means they are accepted by my kids as pentative persons, who wish to join our country, and who there with, qualify as citizens of our country, in an informal manner. Citizen by proxy means, they give up their old citizen ship, to whatever government they used to belong to, and they are taken in, as temporary full time citizens.

Temporary full time citizen is a term that means they are full time citizens, but on a temporary committal agreement, and that will be made permanent when they have the chance to meet with my children, and

then can swear in, as a permanent full time citizen.

They can then participate at the collection site, in the activities that will be going on, with others, who wish to participate, as they spill their juices, and purify the area with their sexaling juices.

What To Do About Untimely Pregnancies, Health Issues, Medicines, And Regroverative Formulas

My kids will deliver to them, to the men and to the women who surrender and become citizens by proxy, and temporary full time citizens, the needed medications that will help to make their bodies, wholesome and well, and regroverated, as well as the medications that are needed to prevent untimely pregnancies.

Medical And Housing Benefits, And Other Health And Work Related Benefits

My kids will make certain that they will be given the right medications, and my kids will also provide all the same medications for each individual who participates in the collection site activities to purify the area where we will one day set up my ministry with my kids assistance. My kids will also set up other facilities, as well as the ministry facilities. The other facilities will be scattered through out the valley, and they will be the houseing units and other facilities for people to use to become physically fit, well, and well nourished, and healthy, such as gyms, aerobic studios for practicing aerobic dance, and aerobic excercises, as well as sauna and health spa, and swimming, tennis, badminton, cricket, and other sports facilities for baseball, rugby, foot ball, for those who wish to play a friendly game of foot ball, now and then, with the needed bleachers, lighting, and other supportive facilities for allowing persons to attend and watch the games that are going on, not only for foot ball, or for base ball, but also for tennis, soccer, rugby, and all out door sports facilities that will be needed.

When will my kids set up these facilities? They will set them up at the same time or shortly there after, as my kids begin to set up my ministry facilities, and the needed facilities for living and working in the valley area, sexaling for a living.

At that time, the citizens by proxy, and all other persons who have not yet sworn in, but wish to, will have the opportunity to swear in, and then they can enter and use the facilities full time, twenty four hours a day, without any further discussion about it.

All people who participate in the collection site activities, are also citizens by proxy, and as such, will automatically qualify for all medicines, all health supportive medical formulas, and all youthfulness prolonging, or regroverative formulas, that will feed all the amoebes, and other cells, or living beings in your bodies, and that will feed all the living beings in your bodies, that will then allow you to enjoy full regroveration of your body and rejuvenation of

your youthfulness, youthful energies, and of all the other health benefits that accompany a youthful body, such as more energy, a stronger libido, a more healthful body, and so on.

When do people begin this participation in the collection site activities? As soon as they come out here, to Las Vegas, and arrive in their camper trailers, or caravan buses, or other vehicles, or with their camping gear such as tents, and cooking grills, and so forth.

When Can People Begin To Come So As To Be Able To Participate?

How soon can people begin coming to participate at the collection site in the activities that will be on going at the collection site for some time to come?

They can begin coming to participate any time. My kids will watch out for the safety of all the people who come to participate in the collection site activities. My kids will prevent accidents such as current Lesbianists shooting at people at the collection site, from high rise towers, scaffolding, tall cranes, or from hotel and casino properties owned by the Lesbianists, and from other tall condominium and also from tall apartments buildings and also from normal sized, two or three storey, to eight or so stories, apartment buildings, in the area. Of course, my kids will prevent accidents from happening such as shootings, from all possible locations, and not just from those named structures and locations.

Sniper Points, Places Where Snipers Shoot From

There is no need to blow or destroy them with explosives, in Las Vegas, as there will be no way any one can use those hotels, and other structures, as shooting or sniper points, places where snipers shoot from, to harm any one who is participating at the collection site, in the collection site activities.

In time, every thing will be worked out, and all the people who must hand over their companies, or disolve their companies, and sell or get rid of the assets of their companies, all of that will be in compliance with my childrens' instructions with regards to it, as I've stated about it, already, in brief.

Once the facilities are set up by my kids, and people swear in formally, then my kids can begin to pay people their earned income, for the work they did as they sexal for a living, and for their work, as they spill their fluids, to purify the collection site, the collection site area, and the general vicinity.

Pocket Knives, Construction Tools, And Miscellaneous Daily Life Management Tools And Equipment

No one needs to bring weapons to the collection site area, or to Las Vegas, as they will not be needed, and pocket knifes are okay, and construction tools are okay, but they will be for daily use

activities, only. Daily life management tools are forks, knives, spoons, chopsticks, plates, dishes, glasses, coffee cups, can openers, bottle openers, cork pullers, and these types of things, as well as all the other types of kitchen use tools for cooking food, for eating food, for drinking beverages, and for the collection of garbage, and food wastes, and for cleaning up their eating and cooking utensils, such as portable wash basins, and portable gas stoves, or fixed stoves, fixed wash basins, fixed showers in camper trailors, and in caravan buses, and so forth.

Hookups For Travel Camping Vans And Similar Vehicles

We have no hookups at the site, for water supply, electricity, or sewage, as yet, but the instructions that my kids will make available to persons who come in to my kids' underground facilities - the protected and encapsulated living environment - those persons who go in to recieve the instructions, and other information they must recieve on companies and assets, and persons moving on, and on persons staying, and other information needed to successfully carry out the removal of hotels, and the demolition of buildings, etc. which my kids will handle with the technologies they have available to them for their use for these purposes, and for other purposes.

Cleaning Up The Area And Throwing Away The Garbage

My kids will also handle the required steps for clearing up of the litter and garbage in the area, all of Las Vegas, Pahrump, Henderson, Laughlin, Mesquite, North Las Vegas, Arizona, New Mexico, California, Utah, and beyond, above ground and below ground, and for cleaning up the areas, and for removing the underground and above ground garbage, or city buildings and Lesbianists' structures, and all structures that are no longer needed, train tracks, airports, roadways, bridges, parks, hospitals, medical clinics, and so on, all of which will no longer be needed.

Schedule For Leveling Of The Ground And Hills In The Area, Removal Of Unsightly And Smelly Garbage

Initial leveling of the grounds' areas, leveling of the uneven surface areas, and leveling of the sloping areas, and of the tiny hills, and other uneven and unuseful features to the area, such as hills, low cliffs, and removal of unsightly, smelly garbage, will be done by my kids, with the technologies they have available to them, according to the schedule for making these types of changes, and cleaning up of the area, so as to make the area, one hundred percent, useable for collection site activities, for people to then come in and use the area as a collection site.

Setting Up New Facilities

My kids will take care of all of that, and they will take care of all of the work and tasks for setting up a private collection site area - for spilling purifying sexaling juices, to purify the area - in

accordance with my kids' schedule for these works and tasks for setting up a private collection site area, with tall side walls, and barricade walls, to prevent people from rubber necking as they drive by, so as to prevent car, truck, automobile, motorbike, and bicyle accidents. My kids will also set up the latrines, and other needed hygenics facilities, sleeping accomodations, eating facilities, rehydration facilities, co-opted bathing facilities, sports and excercises facilities, and other facilities.

Co-opted facilities means facilities used co-optively by men, boys, women and girls. Co-optively means, in cooperating measures with each other. Cooperating measures means, each of the four groups of people, men, boys, women, and girls, will work together, to keep the facilities sanitary, clean and healthful, neat and tidy, and safe for use, keeping young children from playing on the stairs for the elevated latrines, and keeping young children from getting in the way of asscending and descending users of the co-optively, or cooptively managed facilities.

Fountains And Showering Lamponeers

My kids will also use their high tech teletransportation technologies for removing toddlers from the stairs, and for placing them in a much safer location, such as in a near by sand garden, or play area, with sandy areas, and with toys to play with, and with cold showers, or showering fountains, people can refresh themselves under, and with fresh water to drink.

Lamponeers are showers that shoot up from sprinkler systems embedded in the paved surfaces, or concrete like surfaces, that shower water up and over the area, up and above and over persons who are there, to cool every one off.

Restaraunts, Clubs, Lounges, Eateries, Cafeterias, Bars, Pubs, Bicyle Paths, And So Forth

Bicycle paths, mini bike paths, walking paths, with rest stations, for refreshments and food, will be set up, and restaraunts and other facilities will be set up, nearby and they will be accessable by following these foot paths, bicyle paths, waling paths, and so forth.

All needed facilities for all parties, such as accomodations, living quarters, health clinics, excerize facilties, swimming pools, saunas, spas, and clubs for eating and mingling with persons, either in light weight evening wear and garments, or partially naked, or in the buff, will also be set up by my children for the use by all legitimate collection site participants. Gurkian Laws apply, and no other laws, such as local area laws, will be enforcable. Police and others will be turned away, and the rights of participants at the collection site area, will be protected one hundred percent, as we begin to change over to the new Gurkian Laws we will all be living by, from now on.

Dealing With Criminally Minded Persons

Any violators of the Gurkian Laws, codes, statutes, and so forth, my kids will arrest, and detain, and then place into prison cells, and then sentence them, in accordance with the sentencing requirements under Gurkian Laws, etc., and they may end up doing humiliatory punishments, or community clean up activities. In any case, they will be arrested by my children, who will use their high tech, biometrics and teletransportation technologies, and their other integrated technologies that they have, to swiftly remove the violators of Gurkian Laws, from the collection site and from the collection site area, and vicinity, and that will effectively cancel out their participation, until sentencing has been given, and until penalties have been leaned.

Penalties have been leaned, means, they have undergone sentencing, and the penalties have been enforced upon the violators, i.e., the guilty parties.

Alterations, Modifications, Changes, Clearing Up And Removal Of Garbage In The Areas, And Additions Time Schedules

These modifications, alterations, changes, and additions, etc., will occur over a period of time, as my kids have a schedule for all of these changes, modifications, alterations, clean up, and additions, etc., and they must stick to the schedule, so after you arrive, if you do not see some thing you feel should be there, by then, it is not there because it is not on the priorities facilities and priorities changes, etc., schedules lists.

Texas requires cancer vaccine for girls

By LIZ AUSTIN PETERSON, Associated Press Writer

AUSTIN, Texas - Bypassing the Legislature, Republican Gov. Rick Perry signed an order Friday making Texas the first state to require that schoolgirls get vaccinated against the sexually transmitted virus that causes cervical cancer.
ADVERTISEMENT

By issuing an executive order, Perry apparently sidesteps opposition in the Legislature from conservatives and parents' rights groups who fear such a requirement would condone premarital sex and interfere with the way parents raise their children.

Beginning in September 2008, girls entering the sixth grade - meaning, generally, girls ages 11 and 12 - will have to get Gardasil, Merck & Co.'s new vaccine against strains of the human papillomavirus, or HPV.

Perry, a conservative Christian who opposes abortion and stem-cell research using embryonic cells, counts on the religious right for his political base. But he has said the cervical cancer vaccine is no different from the one that protects children against polio.

"The HPV vaccine provides us with an incredible opportunity to effectively target and prevent cervical cancer," Perry said in announcing the order.

"If there are diseases in our society that are going to cost us large amounts of money, it just makes good economic sense, not to mention the health and well-being of these individuals to have those vaccines available," he said.

Merck is bankrolling efforts to pass state laws across the country mandating Gardasil for girls as young as 11 or 12. It doubled its lobbying budget in Texas and has funneled money through Women in Government, an advocacy group made up of female state legislators around the country.

Perry has several ties to Merck and Women in Government. One of the drug company's three lobbyists in Texas is Mike Toomey, Perry's former chief of staff. His current chief of staff's mother-in-law, Texas Republican state Rep. Dianne White Delisi, is a state director for Women in Government.

Perry also received $6,000 from Merck's political action committee during his re-election campaign.

Texas allows parents to opt out of inoculations by filing an affidavit objecting to the vaccine on religious or philosophical reasons. Even with such provisions, however, conservative groups say such requirements interfere with parents' rights to make medical decisions for their children.

The federal government approved Gardasil in June, and a government advisory panel has recommended that all girls get the shots at 11 and 12, before they are likely to be sexually active.

The New Jersey-based drug company could generate billions in sales if Gardasil - at $360 for the three-shot regimen - were made mandatory across the country. Most insurance companies now cover the vaccine, which has been shown to have no serious side effects.

Merck spokeswoman Janet Skidmore would not say how much the company is spending on lobbyists or how much it has donated to Women in Government. Susan Crosby, the group's president, also declined to specify how much the drug company gave.

A top official from Merck's vaccine division sits on Women in Government's business council, and many of the bills around the

country have been introduced by members of Women in Government.

Morals For A Sane Society - It Is Now Time To Destroy The Lesbianists - Destroying The White House, Balitimore, Maryland, And Virginia, Killing The President Of The United States, Mr. George Walker Bush, Jr., And Sinking The Eastern Coastline Of The United States Into The Atlantic Ocean - Chaos Every Where In My Universe - Bringing An End To The Chaos In My Universe - Surrendering And Repentance - Lesbianists With Non Repenentant Attitudes Who Will Not Surrender - Orders To Kill All Presdential Candidates, Etc. - New Coins Ready And Are The Ever Useful To Us! - Public Nudity And Public Sexaling - What Does The New Moralicity Mean, In Plain Language? Sexaling Is An Absolute 'Good' And An Aboslute 'Right' - Free Action Sexaling Updated: 13-02-07 Rev.a. 00.a PST 23:25

Morals For A Sane Society

To not fuck a person when you can fuck a person is a wicked act.

Not to fuck a man or a woman in the mouthal hole, or in the buttal hole, or to not fuck a woman in the vaginal hole, when you can, and when you are healthy, and when you have the time for it, by refusing, for what ever reason, other than mental illness, or 'gayist' reasons, you are committing a cheap and wicked act, when you refuse to fuck the other person, and use your dick, or your tounge to felate or kiss and tickle, and lick at the ladies' groinal area, and her vaginal cleavage, and vaginal flaps, or labial flaps, or labial tissue, and also her labial throes.

To not suckal a dick or a scrotum or tickle the males' groinal area, with your tounge, or with your fingers, and so forth, when you are able, and ready, and capable, is a cheap and wicked act, whether you are a woman or a man, girl or a boy.

You are given demerit points for not sexaling when you can and are able to sexal, and your time permits it.

To not participate in sexaling when you can participate in sexaling, is a wicked act. To prevent others from sexaling with you, or prevent a person from sexaling with you and your friends, these are both wicked acts.

A kindly and goodly person is a person who sexals all he or she can and who participates in sexaling with people, all he or she can, when ever he or she can to help those people, and one self, to erase the negative karmic markups each person has, and to help to create the wonderful energies that you can create by sexaling, and to change our universe into the nice place we need to change it into for us to live in, prospering with each other, in kindly loving embraces with each other.

If you stand or sit, talking, drinking, eating, with your clothes on, arguing, and discussing football, or baseball, or the local news on TV, or whatever, and you if you are not sexaling, as a result of your actions, when in fact, you could be sexaling, and helping to purify all the people around you, and yourself, as well, you are commiting an evil act, and an immoral act. It is immoral to behave in an uninterested manner, towards sexaling, and towards helping others by sexaling to purify their karmic markups. You are engaging in wicked, unkindly, and evil behavior, by non chalantly staring out the window, at a restaraunt, or in your car, with others around you, thinking about your miscellaneous thoughts, and by your not attempting to purify others, with every ounce of energy you have got, by sexaling with them, in a safe manner.

We do not want you to drive down the road, sexaling, and not paying attention to the traffic, and thereby causing accidents, and there be causeing harm and injury to self and to others, thereby preventing one self and others from their being able to freely mobilate, or move around freely, or ambulate, as they say in modern English, and then freely participate in sexalating activities of fucking, sucking, tounging, massaging the bodies, and the titties, and buttholes of women and girls, and massaging their kissing lips, and their vaginal lips, their facial cheeks, and their butt cheeks, and so forth. You must drive safely, and make it home, to a safe place, where you and your friends can freely sexalate with each other, without others interefereing with you.

A wicked or evil person is one who prevents a person from sexaling, and who destroys or ruins another person, physically, mentally, morally, emotionally, psychologically, or psychically, so that the other person can not participate freely and fully in holy and pure, GODLY sexaling activities.

This type of person who prevents others is a ruinous person, who will invite ruin and disaster to his or her doorsteps, and into his or her life.

There are many ruinous people, who execute others, and who torture, and cause pain, and suffering to others, and who disfigures others. These people who execute others, and who terminate their ability to sexal, prospering with others, making our universe into the kind of nice place we all want to be living in, together with each other, are wicked and evil people.

It Is Now Time To Destroy The Lesbianists

However, when we have a problem of the size and the magnitude of the Lesbianists, that we have, today, in this period of chaos, across my universe, and the Lesbianists' who are toying with humanity, and with all human beings who are not Lesbianists, it is time for us to take action, to prevent them from toying with us, and put a stop to their amusing themselves with their toying with us, any further, and it is now time to destroy them.

"I am Arjuna, a wickedly angry man, and I come to protect those who can not protect themselves. I will kill and thrust my sword and lance through the hearts of men and women who evilly try to prevent people from being prosperously good and bekindly to others."

This is a stanza or sentence from one of my writings, of old. 'Wickedly angry' in this sentence means, outraged, and furious, so much so, every one is scared and afraid of me.

I am 'wickedly angry' and I am here 'to destroy' those who would fuck us up, and ruin our lives, and make our lives miserable, as they toy with us.

My name is GOd, but in my Buddhist scriptures, I am referred to by many names. One of my many names, as I appear to people, in many and various personas, is Arjuna.

I have many sides to my character, as I am GOD, and I am here to protect my children, no matter what the name is people use to refer to me by, and that I am known by, and no matter how it is and no matter who it is among my many children, who I will protect from wicked and ruinous people.

Destroying The White House, Balitimore, Maryland, And Virginia, Killing The President Of The United States, Mr. George Walker Bush, Jr., And Sinking The Eastern Coastline Of The United States Into The Atlantic Ocean

There will not be any further Lesbianists living in Washington DC, or in Baltimore Maryland, or in Northern Virginia, and that vicinity, above ground, and below ground, if some one will be so kind as to place a very large explosives, fuels, chlorine, high heat burning metals fragments, and fracturable rocks bomb, outside the gates to the Washington DC White House, where the number one enemy, Mr. George Walker Bush, Jr., President of the United States, lives, and works, and then detonates that bomb, out side the gates of the White House, where the president lives, currently, and then destroys him, and his

White House, a lair for Lesbianists, with multitudes of torture rooms, i.e, lots of them, below and inside of the White House.

You will destroy and kill the President of the United States, Mr. George Walker Bush, Jr., and Mrs. Barbara Bush, Jr. and every one else who lives at 1600 Pennsylvania Ave. Washington DC.

Why are we going to throw all these people into my Epcot Center. Once in my Epcot Center, they can freely sexal with each other and they can earn merit points.

That will help them straighten out their karma, and it will help them to have a nicer life, when they are born as tummy babies. There are many tummy mommies who will match up with these people, and when they come out as tummy babies, they can start their life, with us, out here in my universe with us, again.

Am I a wicked wrongful person for terminating so many people's lifes? No. Why not? Because that is the only way we can over throw the vastly wicked and evil Lesbianists who practically rule my universe, with their perverse friends, and there are many groups of perverse friends, who we are going to get rid of, and send into my Epcot Center, one after another, as we move ahead, in our efforts to clean up our universe, and in our efforts to stop this nonsense of senseless killings and torturings of people, for amusement, and for game playing.

The Washington White House is one of the homes for these perverse people who game play and toy with all human beings who are not Lesbianists, who live on this planet.

We have many Lesbianists to trash, and to say good bye to, before we can begin to get our world, straightened out, and started up again, with a new culture, with new morals.

We will throw out their old cultures, their Lesbianistic cultures, and we will replace them with our new culture, and our new civilization, that is based on my religion, and on the sanctity of sexaling as a common sense value.

Sexaling is a sacred and holy act. Even if you sexal with a kangaroo, or a chimp, it is still a sacred and holy act.

Why is that? It is because every body is made of something, and that something comes from me, GOD. That something from me, is pure and holy, as I am pure and holy. I designed every person, and every animal, and every living being, with sexaling capabilities that allow that pure and holy GODLYNESS to come out once they begin sexaling.

That GODLYNESS begins to radiate out, as each person begins sexaing, and as each animal begins sexaling, and as each living being begins sexaling, eroteming, orgasming, and phlumetting, and it purifies each and every living being, and washes away the karmic markups every

person, and every animal, and every living being, has in them, and has stored in the molecules that are stacked up in my universe, out side the boundarary walls that hold this universe up, and that keep us in side of the area we are in, and that keep the rest of my universe standing up, stable, making this a safe place to live, at least, safe in so far as nothing comes crashing down on us.

My kids are expert builders, and it is thanks to them, that we have such a nice and safe, and well built universe to live in. It is also thanks to them, that we have these bodies to live in, and to sexal with, since my kids put us together, one molecule at a time, as we need to have our parts put together, along with all the anmials, and living beings, who are inside of us, that my children also assemble for me, and for us.

What is this GODLYNESS? It is a purifying force, that is of me, and is me. It is inside of every one, and inside of every creature, animal, and living being, in my creation.

This is woven into the fabric of your being, and it is of me, and is always a part of me, and is always connected to me. Since I am always pure, and GODLY, you have a possibility of becomeing pure, and holy, like me.

Right now, we are filthy, and grimey, and all gunked up, with sludge, and residues of our karmic heritage. We have done many things that contribute to who we are, and to what we experience, day to day, and if we are not happy with our life, that is because we have the karmic records and markups that dictate that we must be in this miserable and suffering condition, that we are in, today.

There is always sufferring, and unwholesomeness, in our lives, and around us, every day. There are many wicked things that go on, every day. People perpetrate wicked acts, daily, and they go on, unpunished, for a long time, until their karmic markups begin to add up to sufferings coming out, in that person's life.

Sufferings are your payback for your wicked acts, and they help to keep our universe in balance, as I've spoken about, a little, before.

It may seem unwholesome that I ask you to kill my kids, and put them into my Epcot Center, where they can sexal, and where they can get retrained, and where they can be taught to be nice people, after they are retrained, but my asking you to kill my kids, this is merely an expedient, or a means to an end, and it is permissable, given the circumstances, and given the situation, and given that we are at the begining of our new Age of Gurkian Englightenment.

The result we wish to see by killing them, is an end to the activities of the Lesbianists, and and end to the activities of other people like them, in my universe. The Lesbianists are ruining my universe, and ruining the lives of every body in my universe, and though this was the way things were balanced out, prior to now, we are starting out,

with a new method of 'payback' and a new means to balance out the karmic balance book. This is all to be governed by my rules and regulations, that my kids will enforce, in our new, Gurkian Age of Enlightenment, begining about now.

Our killing the Lesbianists, will help to control their ruinous and heinous behavior and activities, and it will help us to get them out of the picture for a while, until we are able to set up our new government, globally, or universal wide, across our universe, in a one universe government, over seeing the activities of all of my kids. It is the only way we have to begin to get our selves straightened out, and onto our new path, that we will follow, for the rest of eternity.

This marks the begining of the Gurkian Age of Engligtenment, and it marks the end of the previous period, or random, or just about nearly random, chaos.

We went through a very long period of decline, untill we got to the period of chaos that we are in, now. This period of chaos, we call, the 'melt down' period.

The 'melt down' period, came after the 'run amuck' period, when my kids began their severely ruinous activities that led to the period of chaos that we are now in.

Chaos Every Where In My Universe

We are going to begin to pull ourselves out of this period of chaos, with the help of my religion, and with our religious activities, and it is going to take us a very long time to pull ourselves out of it, as this 'chaos' is going on every where in my universe.

It will take us a long time to begin to be able to erase our karma enough, based on my religious principals, and the ethics of the Gurkian Age of Englightenment, and our religious activities of sexaling, dancing and excercising, and sexaling in syncopation with the metronome, at one thirty seventh and one fifth, or so, to then some day be able to have erased enough karma, to be rid of, completely, all these horribalistic people, my horribalistic kids, in my universe. When I say, be rid of them, I'm not saying, to trash them, completely. I am saying, we will put a stop to their activities, by changing our karma, and by purifying ourselves with my religion and our religious activities of sexaling, keeping time, in synch with my children, as we sexal, and as we activiate, playing basketball, tennis, or as we swim, or as we pray Nam Myeo Ho Ren Ge Kyeo, and so forth.

Bringing An End To The Chaos In My Universe

We are going to bring an end to the chaos, and to the chaotic behavior, and abberant, ruinous behavior in our universe, as we bring this period of chaos to a close. We will, as we steadily move forward, open the way for the budding and flowering of the Gurkian Age of

Enlightenment, and to the budding and flowering of the new age of friendship and loving care, among all of my children, who participate in my religious, social, economic, and karmic revolution, as we sexal with each other, lovingly, and strive to clearify and erase our karmic markups, sexaling, and synching our activities to one thirty seventh and one fifth on the metronome. Later we will fix our metronomes to keep exact pace in synch with my children, and after we fix and reset the timing scale of the metronome, the timing will be one thirty seventh, exactly, on the metronome.

Our sexaling will produce all types of wonderful, purifying energies, that will revive our universe, and that will revive us, and that will help us to reclaim our universe, and that will help us to live, prosperously, and prosperingly in our universe, together, with each other, and with every one of my children, as we reform the bad and naughty ones, who are wicked and unkind to others, and who prevent people from sexaling, together, with each other.

That means, we are going to kill all the bible thumpers, Pat Robertson, Orwell Roberts, Billy Grahm, Tammy Faye, Jim Faye, and all the other Lesbianists of every religious faction, or group, whether they are Lesbianists who are christians, islamists, judaists, shiites, hindus, buddhists, black moslems i.e., afro american black muslims, or whatever.

We are going to destroy them all, all who would try to prevent us from what we are attempting to accomplish, a global, universal wide, government, run by me, GOD/GOd, as I am the Captain of this ship, and then we are going to begin our new age of Enlightenment, hand in hand with each other, and when they come out of my Epcot Center, again, next time, to be born as tummy babies, to tummy mommies, and to tummy daddies, we will teach them the new rules, ethics, and morals of our new universal wide society, and then we will begin again with them, and raise them in accordance with the new rules, laws, regulations, ethics, and morals of our Gurkian Age of Enlightenment, led by me, GOD/GOd.

Surrendering And Repentance

Those who will surrender, will be allowed to be repentantent, and they will be forgiven for their misgiven, misbegotten, and ill minded ways, once they begin sexaling with the rest of us, and participating in our religious, economic, and social revolution, and once they begin following Gurkian laws, rules, ethics, the codes and norms of behavior, and our righteous, and correct morals, acting and exerting one's efforts for the sake of others, never sparing a moment of energies, wastefully on trivial and trite activities of gossipping, mischiefing, or other harmful, and potentially ruinous, wicked, and evil behavior.

Lesbianists With Non Repenentant Attitudes Who Will Not Surrender

Those who will not surrender, we will send to my Epcot Center, as that is the only way we can get them out of the picture, temporairily, so that we can then get things in order, before they return, once again, as tummy babies, into the lives of tummy mommies, and tummy daddies.

Orders To Kill All Presdential Candidates, Etc.

You are hereby authorized by me, GOD, John Francis Ayres, to kill all United States Presdential candidates, including but not limited to, Barack Obama, Hillary Clinton, and Mitt Romney. They are to be executed on sight. Also, you are ordered to kill all non repentent Lesbianists, such as, Vice President Dick Cheney, Tony Blair, Butros Gauley, Oliver North, Colin Powell, Oliver Poindexter, Casper Willard Weinberger, United States Supreme Court Chief Justice John Roberts, Associate Justices, John Paul Stevens, Anthony Kennedy, David Souter, Clarence Thomas, Ruth Bader Ginsburg, Stephen Breyer, Samuel Alito, Antonin Gregory Scalia, Arnold Swarzneggar, Sylvestor Stallone, Robert Deniro, Gary Busey, Kevin Sorbo, Timothy Dalton, Michael Jackson, Matt Damon, Bruce Willis, Mila Jovovich, Peter Jennings, all members of the United States Congress who are Lesbianists, and all other Lesbianists, whether in politics or not, and in whatever government you find them, around the world. There are many Lesbianists in local and metropolitan police departments, and in SWAT Team units, and in fire departments, and in the National Guard units throughout the United States, and Lesbianists own every news media organization, television corporation, cable television corporation, satelite television corporation, major radio station, transportation corporation, chemicals corporation, petroleum corporation, coal mining corporation, as well as every other major corporation around the world. You are to kill every last one of them, and spare no one. We will then destroy every underground city they are hiding in, and force them to surrender. If not, we will kill them all, and I authorize you to do exactly that, kill every last one of them, all thirteen billion plus Lesbianists, hiding under the surface of our planet, or out walking about, pretending to be an ordinary citizen on this planet. Nothing is further from the truth, and you are authorized to kill each and every one of them, and send them all to my Epcot Center, using what ever means available, including my tactical, powerful, home made radiological explosives bombs, i.e., nuclear explosives. Please study my notes on my web site for further details regarding radiological fracturable rocks, and my notes on how to make an explosive weapon to detonate nuclear materials, you can find along beach shorelines, in sediments deposits, and on old mountains, every where on our planet, if you have a geiger counter.

New Coins Ready And Are The Ever Useful To Us!

http://money.aol.com/news/articles/_a/new-dollar-coins-enter-circulation-this/20070211095409990001?ncid=NWS00010000000001

"Updated:2007-02-11 15:20:31"
"New Dollar Coins Enter Circulation This Week"
"By WILL LESTER"

"AP"
"WASHINGTON (Feb. 11) - Maybe Susan B. Anthony and Sacagawea should not take public rejection personally. It's not easy overcoming people's indifference to dollar coins, even those honoring such historic figures."

See also,

http://news.yahoo.com/s/ap/20070211/ap_on_bi_ge/money_ap_poll

The new coins reportedly have many fracturable rocks in them, as the metals used, were mined from deposits of minerals that contain large amounts of fracturable rocks.

They also have high heats and high temperatures burning minerals in them, that will level up your thermal temperatures to near solar temperatures, if grinded up and mixed in, and allowed to ferment, in sour berry juices, slowly, with tiny amounts of salt, and large amounts of raw sugar.

The high heat temperatures, and the energies produced at these higher heat levels, will reach near solar heats energies temperatures, and that is very important for developing the energies needed to wake up every body, in the fracturable rocks - or 'fissile' materials, in Lesbianists' speak, or Lesbianists' mumbo jumbo language - to get them to begin making children and families.

Please see my notes on 'Radiological' crystals cages salts kiddies, and other related energical animals kiddies, of various, and hard to imagine, types, unless you're a kid and unless you have the mental flexibilities and typical mental gymnastics capabilities of a normal child, unhindered by brainwashed thinking and brainwashed patterns of thought the Lesbianists have caged, and closeted in the dark, our brains with.

Public Nudity And Public Sexaling

Public nudity and public sexaling is now a way of life for all, in our, now, Gurkian Age of Enlightenment. We will begin broadcasting live sexaling events, and other entertaining and informational, educational programming,, as soon as I get my new quarters, a unit to live in, where I can eat more properly, sleep more properly, recieve the medical health aides and regroverative formulas, that I need, and where I can practice my religious ceremonies, with others, daily.

The public broadcasting of various informational programing, educational programing, sexaling entertainment programing, sexical, hygenical i.e., sexaling hygene, and sexical educational programing as well as sexical training programing, as well as my religious ceremonial sexaling activities, and my general, more typical day to day, religious ceremonialing, for now, until I get my health up to a level of youthful vigor, and robust wellness, as I religiously interact with my students, and train them, the disciple priestesses,

and disciple priests, will all help to set the basis of normative, and expected, social behavior, for all people in our universe, to learn about, now in our Gurkian Age of Enlightenment, so that we can all get along, with one primary set of customs and standard of behavior, and with one primary language for communication, as we will all be sexaling with each other - all of my children who are now just begining to get with the program, at least, anyway, will be sexaling with each other - from now on, and for all eternity.

We need this exposure, as well as alternative programing, for laundering up to, and for begining to expose ourselves to, and learn about, the reality of the universe, my universe, that we live in.

Laundering up to, means, exposing ourselves to the mischievous antics of the Lesbianists, to launder their filthy, garbagical, and tormentuous ways, so that all may learn about them.

This will be coming up, in the near future, possibly, as far as I can determine, any way, after we have the spilling of the sexaling fluids campaign under way for purifying the area where I will be setting up my religious ministry, on the parcel of land, on the north west corner of the intersection at West Tropicana Ave. and South Decature Blud., Las Vegas, Nevada, and possibly on confiscated properties to the north, as well as to the west, for now. This is a public service, informational bulletin, on what you are to expect, in the near future. Prepare yourselves, accordingly.

What Does The New Moralicity Mean, In Plain Language?

Our new moralicity means we are going to learn we can and should sexal with every person, and even with animals, when we have a chance or opportunity to sexal with people and animals, and that we can and should sexal with every person we see, so long as we have a mutual reciprocical understanding of the truth to sexaling, that it is a pure, blessed, and holy act, GOD, me, made possible, to purify you of your blemishes. It is the most significant and powerful way to purify you of your blemishes and karma

You can also clearify your blemishes, your karmic markups, by praying Nam Myeo Ho Ren Ge Kyeo, and by your keeping syncopated and in rythm with my children, helping my children to work smoothly, syncopated and in rythm with each other, perfectly fluxed, meshed perfectly with all my other children, working at different life spins, as I've mentioned about, as my kids will reward you by sprinkling faerie dusts, purifying energies, and other types of related, purifying things and dings, all over you, as a reward for your cooperation in keeping my universe, humming, and running, smoothly.

With your syncopated rythms, your syncopated pace of movement, and actions, as you time your motions, and stay in synch with one thirty seventh on the metronome, plus one fith of a mark on the metronome we currently have available to us, here, on our planet, during your

activitiating, sexaling, playing sports, dancing, excercising, and so forth, you will purify your life, and you will purify the lives of those around you, with your actions, as you get rewarded by my children.

Our new moralicity means we can and should sexal with each and every person possible, in free association with each other, no matter what the age of the person, and no matter what the gender of the person, no matter what the tribal background is, no matter what the tribal heritage is, any place no matter where we are, any time no matter what the time of day or the time of night it is, in public spaces or in private living spaces any and all places, no matter who else is around us, as sexaling is a blessed act that my kids reward you for, any time, every time, no matter where you are sexaling, and no matter with who you are sexaling with, or even no matter what type of animal you are sexaling with.

It means there are no bullshit, propagandists' Lesbianists dreamed up taboos, any longer, regarding sexaling, and that sexaling is a blessed act, and not a 'forbidden' act, as the bullshit Lesbianistic Christians, Muslims, and other religious 'pious' bullshit assholes, who would want us to believe that sexaling is forbidden by 'God', which is complete and total bullshit, and a lie, as they base them selfs on their 'holier than thou' pious 'ignorance' of the truth.

So long as you and the person or persons you are with are equally, mutually, and reciprocally interested in purifying your lifes, and interested in clearifying your karmic markups, and interested in helping my children work in synch with each other, and interested in helping to push my children along, with your energies, and efforts, and so long as you can sexal together with one and each other, without damaging either or any of the participants, it is morally correct behavior, and any person or actions to prevent that morally correct behavior must be condemned, and punished.

Some people, especially young participants, do not have butt holes, mouthal holes, or vaginal holes that are large enough to swallow a dick, or mouthal holes that are large enough to swallow a tittie and suckle it fully, without straining.

You need to spend several hours phlooching out the butt hole, or phlooching out the mouthal hole and throat, and phlooching out the vaginal hole, with generous massage over several hours to the muscles and tendons in the neck, mouth, nose, eye ridges, ears, throat, face, chest, tummy, back, arms, hands, fingers, shoulders, titties, thighs, hips, waist, groinal area, labial folds, vaginal lips, facial lips, male genitals, and the entire torso, back and front, the legs and feet, ankles, and toes, as well, and all parts and areas from head to toes and in between, with continued efforts to massage all these places, until the body begins to respond, and until the body responds fully.

The butthole will loosen up, and the throat hole will loosen, and the mouthal hole will widen, and the vaginal cavity and vaginal mouth will widen and expand in size, and the groin in girls will spread apart, allowing for more room for access to the vagina, and for smoother access to the butthole, as the hips loosen up, and begin to spread apart in response to your efforts at massaging the body, to prepare it for sexaling.

No matter how old a girl is, and in the case of a boy, no matter how old the boy is, baby, child, adolescent, or adult, phlooching out the sexaling orifices, is easy, if you spend the needed time on preparatory and thorough massage, sufficiently enough.

That's how I designed your bodies to respond to massage efforts to loosen up the muscles, ligaments, sinews, cartiladges, so as to allow the bones of the body to move and spread apart, freely, and loosenly. Your body is like a rubber band, and if you massage it, well enough, it will begin to respond like a rubber band, and it will loosen up, and spread apart, where it needs to spread apart, so as to allow you to sexal, thoroughly, and continually, for as long as you continue your sexaling activities.

After you finish your sexaling activities, your body will begin to stiffen up, as all the ligaments, sinews, cartiladges, muscles, and fiberous threads throughout your body, begin to tighten up, for returning to daily life, working activities, where you need a hard, and tough body, to survive, as you work in the field, or work in the rice paddies, or work on the farms, to labor for producing crops for feeding you, your families, your children, relatives, tribal village friends and tribal villages neigbors, who are, or who used to be, traditionally, as life used to evolve for us, all related to all of those concerned in the area, or on the planet, for that matter, or in the entire galaxy, or spread out over many galaxies, and even spread out over even larger, and wider areas of my universe in the large, familiies that used to be the norm.

You may need to spend several hours, or even several days, or maybe even longer, a number of weeks, or even a number of months, before the body will begin to respond, and begin to flex, and bend, to help all the ligaments, sinews, cartiladges, tendons, muscles, and all the body parts, and supporting, interwoven parts of your bodies, as I've briefly talked about, before, as well as all the lubing stations, that will eject fluids to assist in the loosening up of your bodies' ligaments, sinews, cartiladges, tendons, muscles, and even the bones, to allow them to be more flexible, including the jaw bones, facial bones, neck bones, spinal bones, leg bones, thigh bones, hips bones, pelvic bones, buttal bones, groinal bones, back bones, and all the bones of the body. Every bone in your body will loosen up, and become more flexible, and pliant, durile, durable and tensilely strong, as you massage all the parts of your body, and the bodies of the people you are sexaling with, very young, young, adolescent, adult, middle aged, elderly, and even the ancient, or the extremely very old.

This is the truth to this matter, and you can find out for your selves, if you try and see how your bodies respond, to daily, rigorous, continued massage, over various lengths or periods of time.

This is part of the ancient and old art of sexaling, as I taught in my religious teachings, in every religion that I taught, and I have taught a lot of religions in my time, to lots of different peoples in my universe, from the begining of our time, here, together, in our universe, after we arrived, which I've talked a little about, before.

Sexaling Is An Absolute 'Good' And An Aboslute 'Right'

Even the veryest oldest and the veryest youngest have a right, duty, and obligation to sexal and produce holy, sacred, sanctifying, i.e., to make sacred, holy, and pure, harmonious, purifying energies.

It is an 'A B S O L U T E' RIGHT as in, a 'right' to free speech.

It is also an 'A B S O L U T E' RIGHT as in, 'this is right, correct, upstanding, laudable, commendable, proven to be always right, correct, true, holy, graceful or GODlYNESS and GOODLYNESS gracefilled, morally right, morally correct, morally absolutely right, and morally absolutely correct', as opposed to, right and wrong, i.e., as in the opposite of wrong, as in, that is wrong, that is incorrect, evil, hateful, sinful, morally inaccurate, morally wrong, morally defunct, undoable as it will not stand, and useless,'.

It is also an 'A B S O L U T E' GOOD and an 'A B S O L U T E' GOODNESS.

Free Action Sexaling

Anything that counters, or runs contrary to this, is an 'A B S O L U T E' WRONG, and an 'A B S O L U T E' EVIL. It is absolutely wrongful to deny or to prohibit or to interfere with, in any way, with any one who wishes to sexal, as THAT PERSON IS CLEANING UP MY UNIVERSE WITH HIS DICK, OR WITH HER VAGINA, BUTT, AND TITTIES, AND WITH HIS PURIFYING ENERGIES, OR WITH HER PURIFYING ENERGIES! DO YOU UNDERSTAND THAT?

Any body who even attempts to impede, to deny, to prevent, or to interfere with, in any way at all, with a person's absolute right to sexal runs counter to Gurkian laws, regulations, codes, ethics, morals, standards, and you will serve jail or prison time, for prohibiting, or interfering, or impeding, or violating in any way, a person's absolute right to free action sexaling, which is, the act of freely chooseing who one wishes to sexal with. DO YOU UNDERSTAND THAT, SOLDIER? GOOD! BECAUSE A "NO SIR!" WOULD BE INAPPROPRITATE AND UNACCEPTABLE!

To learn more on these subjects, swear in, and become a citizen of our country, and begin studying, and working in the many programs my children have for you to study and work in, to score earning points, and to earn a living in our new, Gurkian Age of Enligtenment, where

and now that we work, and we pay as we go.

Those who refuse to work, in time, will be required to work, to pay off their debts and to pay off the fees that are owed for the use of my resources, all the molecules in my universe, and all the resources, energical, or otherwise.

Even though I am GOD, in our new system of working in my Gurkian Age of Enlightenment, even I have to pay for the resources that I use, as I work as chief priest of my religion, spiritual director of my universe, and boss of my universe.

I'm the mother and father, the creator of all humans, animals, and living beings, as I've explained, every thing in my creation, and people will begin to understand that, that I am GOD, as they practice my religion, over the years, and over the aeons, and over the millenias.

The people who refuse to work, will be required to work in prisons, sexaling with animals, to produce sexaling energies that will restore the supplies of energies in our universe, as I've mentioned about, before, as they work and learn their new trade of animal husbandry, and animal wifery, in the animal habitry industry, as I've also mentioned about, in earlier notes.

No matter what the age of the person, every person can participate in our Gurkian Age Of Enlightenment, sexaling, dancing, excercising, and syncopating their movements, in rythm, to assist my kids as my kids, work to keep my universe, strong, durile, flexible, safe, and a nice place for every one to live in.

DO YOU UNDERSTAND THAT? YOU HAD BETTER, AS A "NO SIR!" WOULD BE UNACCEPTABLE, SOLDIER! DO YOU HEAR ME? I HOPE YOU DO! NOW, GET TO WORK AND SEXAL TILL YOU DROP, SOLDIER, AND I'M NOT JOKING!

We will build a nice and comfortable, safe place for every one to live, now, in my universe, and we will follow the Gurkian Age of Enlightenment Rules and Regulations, Codes, Morals, Ethics, and behavioral norms, that you are required to live by, now that we are going to become, one, very big, happy, harmonious, in synch, prospering family.

You will not forget to wash out your butty butt holes, and to flush out your vaginas, and your mouths, and to practice proper and health promoting sexaling and love making hygene, with the medical formulas that my children will be providing to you, and that you will pay for, out of your earnings, and they are very reasonably priced, now that I am making every thing available to every one, at a set, yet, flexible, and low cost for the use of my resources, once you citizenize your selfs, and swear in, as a citizen of our new, global, i.e., universal wide, one universe, family of GOD's, that's me, children.

The costs are flexible, in the sense that you do not have to pay, yet, as you will be learning about the ways to work, and you will be learing and preparing your selfs for a new working life, in my universe, for some time, and so we have no hurry to have you pay for the resources you use. We can collect the fees, and costs for resources, in the future, when you are a big money earner, once you learn your new work requirements, for sexaling for a living, as that is the only job opportunity open to every one, and the only job opportunity, that you have a choice about.

My working children, though they do have many different jobs, they have basically the same set up, or arrangements as you now will have, and so you will be joining my children, and you will be working, i.e., sexaling, excercising, aerobically dancing, and so forth, in synch, and in rythm, for me, just as all of my children are doing, at least, those of my children who are able to work, and who are bright and intelligent enough to work for me, to keep my universe, healthy, safe, solid, durile, strong, wholesome, and a nice place to live in.

That means, I have a lot of burnouts kids, and rampant, vagarous, dangerous children, who are not really very bright, and they do not work for me, yet, but they will, in time, regardless of the fact that they may at the present, be abominants kids, or not.

As I've mentioned, all my up until now, non working children, are abominants. What does that mean? It means, they do not give a darn about killing another person. They kill for selfish reasons, and for fun and games, and so forth, and you are all guilty of that, though you may not remember that you killed for fun and games, and for selfish reasons, in previous lifes, in my universe, but you all have, and you are all abominants, of varying degrees.

So, welcome to the Gurkian Age of Enlightenment, and welcome to my workforce.

The flourescent lights blinking on by themselves and buzz
tones in the 16 mm motion picture projectors' audio were
common at the Radar Basics classrooms of Fort
Monmouth, NJ, in 1952. The high-bay where 1 MW peak
pulse search radars were set up were constantly annoying
the instructors across the street in the classrooms. <shrug>
Got annoying to the students too.

But, none of that was in the league of "frying auto electronics"
nor any real danger to humans at a half block distance.

Well, some of the schematics I've been looking at are for CW rigs.
(Glowbug rigs, in particular.) You have me wondering, though - I
thought digital radio used the same bands as commercial radio?

Nope, amateur radio digital transmissions use amateur radio bands.

From: John Baxter <mailjohnbaxter@gmail.com>
Message-ID: <12t8f8hieolt13f@corp.supernews.com>
Source record: 8356

Hi,

Can anyone tell me where I can obtain Kanga kits in the UK ? I understand that G3ROO has stopped trading in the UK.

I was looking to build a ONER, OXO and SUDDEN 2. I know I could buy the components seperately but I liked the idea of the kits with printed PCBs.

Perhaps the kits are available elsewhere, but I do want to avoid paying as much in postage as I would for the kits !

Many thanks,

73 de John

518. German suppliers of components and wire

Hi,

Can anyone suggest a good supplier of electronic components and 300 ohm feeder in Germany, ideally that has a website from which I can order. I am only wanting small quantities for home construction.

Many thanks

John

==========
Conrad for general electronic components(similar to Maplins in the UK)

Kusch for 300 and 450 Ohms balanced feeder ,coax, coax connectors, etc
Kusch is a family company visiting most AR-rallies/fleamarkets in D and NL

Both companies have web sites

ken scharf wrote:
> Wonder if A2 operation with USB tone modulated code would be legal on
> these bands?

Probably not. Unless of course, you retitled it "pentature encoded tone shift digital modulation". Morse code is really 5 different bits of information, dit, dah, between character space, between letter space, and a between word/empty space. If you count the space between messages as a seperate data point, then it becomes hexature encoded.

Bear in mind Morse code was designed to be used in a mechanical punched tape sending device. It was never meant to be sent or received by hand. It was just by accident that an operator found out he could copy the message directly into his head by listening to the sound of the pen.

Vail, not Morse, replaced the tape sender with a hand key, and dropped the pen from the receiver.

Like "diHydrogen monOxide", it could become popular on the Internet.

APRSPoint 4.2 is uploaded,

1. This new version has improved tracking support by adding separate track lists for stations to be tracked over either RF or TCP link.

2.It also added a new reject field in the filter dialog, where you can specify a list of stations to filter out using multiple strings that can contain wild card characters.

3. It allows you to selectively remove stations from the tree view list. This combined with improved filter operation, enables you to dynamically adjust what gets displayed on the map.

Please visit http://www.aprspoint.com for details and download.

Thanks, Michael KF6ZDM

Ahem...small disagreement there. Morse's original "code" was
all numeric and the receiver was an inked trace on paper tape.

> Vail, not Morse, replaced the tape sender with a hand key, and dropped
> the pen from the receiver.

Alfred Vail's family was Morse's financial benefactor. The Vail
locomotive works tried to get the ink pen receiver to work
reliably and couldn't. At the same time Morse was having
trouble organizing his all-number "code" to cover enough
English language common phrases. According to the Vail
family website information, Alfred Vail suggested to Morse that
the whole English alphabet should be part of the "code."
Alfred suggested copying the frequency of letters of a printer's
type case as a way to make the most-used characters take
the least time to send.

Eventually, long after the hand key and acoustic "sounder"
were in common use, the ink-printed-on-paper-tape (or drum)
came back for very long circuits such as under-ocean lines.

> Like "diHydrogen monOxide", it could become popular on the Internet.

Good stuff! I have a couple glasses of dihydrogen monoxide
every day! :-)

I even shower with it! :-)

Also the "Morse" code invented by the man of the same name is NOT the

same cypher (it's NOT really a code!) that we hams use over the air. WE use what's actually called the "international radio telegraph" cypher (code). True Morse has characters based on dots, dashes, long dashes, and variable spaces! Also as sent over the land line the operator had to listen for the gap between clicks NOT the sound of the clicks! Try that folks!

Also, don't forget that the sampling rate of the sound card doesn't have
anything to do with the preamlifier stage that you are trying to build. A
stage that is limited to the audio range will be fine. Any of the higher end
op-amps will be fine.
The Analog Devices OP275 is a good choice, because of its fast settling
time.

Pete

If this is the one I think it is, they are as rare as hen's teeth.
Look for a high value choke (50H or more) or connect the primary and
secondary of an audio interstage transformer in series-aiding. Couple
with a .05 uf capacitor and use a suitable grid resistor in the next
stage (100k-1meg ohm).

A couple of years back there were cars that included the caveat that any transmitter installation would void the warrenty. Now that everyone and their brother uses their cell phones in the car I guess they don't put that notice in anymore.

Back in the mid 1970's I was in NROTC in college. There it was mentioned that an EA6B (the electronics warfare version of an A6) could pulse its radar and fry the electronics of a plane in the cone if it was close enough (under 1 mile if I recall correctly). Anecdotal stories like that are the source of electronic killing rf. That involved a multi megawatt microwave pulse, not something you would normally see in an amatuer installation.

Living in an apartment, years ago I tried putting a 10 meter dipole across the ceiling in a stealth installation, I shut down when the residents above me complained that their tv would scramble while I tried running psk31.

You may not blow out their electronics but can definately interfere with them if they are close enough.

thanks, John.

If your system board is only 1-3 years old, the audio interface that is
built on it, makes a good starting point.

Some years ago I keyed up a 2 meter handi-talkie (maybe 2w out) with the
2 meter rig about a foot away from a Radio Shack 5" portable color tv.
The 2 watts of 2 meter rf caused the TV to self destruct! I think
something in the horizontal output section died. The TV was operating
at the time (it probably would not have happened if the tv was off).
The set was repaired by Radio Shack.

>same cypher (it's NOT really a code!) that we hams use over the air.

Irrelevant in the historical context of 1844 (163 years ago)
and the beginning of the Morse-Vail Telegraph Company...or
the period of 52 years of landline telegraphy before the
first demonstration of radio as a communications medium in
1896 (in Italy and Russia). In that period between 1844
and the "turn of the Century" (1899-1900) landline telegraphy
became a mature financial success and was duplicated (in

"technology") around the world, partly on the Morse-Vail innovation-invention of the "relay." That "relay" enabled a single telegraph circuit to extend over three times its un-relayed length and reduced the capital investment of the telegraph companies.

Underwater telegraph lines proved a financial success despite the high cost of such telegrams. But, technically, such under-water lines suffered high line losses, necessitating the return to galvanometer-like ink pens at the receiving end... the original intent of Morse's telegraph system.

The word "code" is a very, very general descriptor of any system that uses a REPRESENTATION of a language or communication data. Other examples are the so-called Baudot code (5-level) or ASCII, the American Standard Code for Information Interchange (8-level) in teleprinting systems. The word "cypher" also has many meanings (including old references to mathematical operations) but, in the modern sense becomes more allied with cryptographic methods of obscuring the meaning of communications. See 'crypto' references to differences of "cyphertext" and "cleartext."

In the half-century prior to 1900 ("turn of the century" in the phrase of older times), a great number of different "dialects" of the "morse code" were generated, mostly to fit the languages of its users. By that turn of the century time land and sea telegraph systems had multiplied and were confounded by all the various languages and dialects of the telegraphic code. That was resolved somewhat by an international standards group called by the French acronym CCITT. The CCITT resolved a great number of communications means, protocols, tariffs, and methodologies to enable a quicker 'throughput' of communications between countries. What eventually came out of the CCITT telegraph standards work as the "international telegraph code" was based on the English alphabet, numerical notation, and punctuation. That wasn't because English was a "better" language but simply that it was the MOST USED language for international telegraphy AT THE TIME. Note that the teleprinter codes were also standardized on the 5-level system. Teleprinter systems would eventually dominate and succeed telegraphy systems for international communications.

Geoffrey and I were communicating on the OLD technology of (largely) manual telegraphy systems. It is not demeaning to say that such pre-1900 technology was PRIMITIVE. It was. There were no vacuum tubes to amplify anything and certainly no "radio" (until 1896 public demonstrations). Exactly what the early manual telegraphers did is relatively unimportant to the modern-day radio-electronics amateur

radio world. Whatever they did was a relative success over
a half-century of use and growth. But, that success was
based on PRIMITIVE electrical technology.

What seems to be overlooked in early telegraphic technology
is the remarkable innovation of the RELAY. A simple electro-
magnet driving a contact. Make the electromagnet sensitive
enough to work with a 30-mile stretch of wires...wires NOT
made to uniform standards which had not yet been developed.
This simple relay could form an UNATTENDED telegraph station
along a route, having its own battery for powering the out-
going line to the next station, keyed by the relay contacts.
Up to three unattended relays could be used on one
circuit...reaching up to 100 miles in length before the
circuit characteristics began causing errors in transmission.
No real time of transmission ensued, something that had to
be considered with attended stations and the operator copying
down one telegram, then resending it manually to the next
station. Think of the telegraphic relay as a predecessor
to the modern-day radio REPEATER. Same unattended method
of relaying a communication, almost in real time.

>WE
>use what's actually called the "international radio telegraph" cypher
>(code). True Morse has characters based on dots, dashes, long dashes,
>and variable spaces!

That code is fully described as to dots, dashes, and spacing
in the referenced document given in the "Definitions" section
of Part 97, Title 47 C.F.R., as it applies to USA radio
amateurs. I have a copy of that, purchased from the ITU.
Interestingly, that same document does not define the
equivalent rate-of-transmission...although the USA amateur
radio regulations imply that it does.

>Also as sent over the land line the operator had
>to listen for the gap between clicks NOT the sound of the clicks! Try
>that folks!

Irrelevant as to what any telegraph operator did prior to
1900...except for historical notation. None of the participants
of any newsgroups were alive then and therefore none can be
"witnesses" to corroborate methods of early telegraph reception.

Perhaps the first appearance of the "BFO" in radio reception
was an experiment by early radio innovator Reginald Fessenden.
Fessenden ran a low-power Spark transmitter next to his early
receiving detector and noted that detector sensitivity was
increased (his major area of experimental research at the
time. He did not coin any term such as "beat frequency
oscillator;" that came later after Armstrong invented the
"super-heterodyne" receiver (name in reference to Fessenden's

experiment notation) with a fixed-tuned IF.

To simulate the "listening between clicks" on a radio, simply turn the BFO OFF with a strong "CW" signal coming in. That isn't a good duplication because there is a slight hiss of the distant carrier when it is on, perhaps a tiny bit of hum. If the distant signal is weak, the spaces between carrier-on dots and dashes would have some random noise. Either way, it is not a good way to "copy CW" without that BFO.

The start of this thread was a question on whether or not FCC 06-178 that goes into effect on 23 Feb 07 will "eliminate the CW bands." It will not as is noted in FCC 06-178. Let's not deviate into esoteric realms of potential flame-war ignition about "true morse code." USA amateur radio regulations are rather specific on the relative lengths and spacing of International Morse Code as defined by the ITU.

As to "homebrew" subjects, I submit that the Morse-Vail telegraph patent was an example of that in their "relay." Electro-magnets were known in 1844. Wire characteristics and early DC batteries were known. The telegraph patent connected them all in that "relay," something that no one else seems to have done at the time. Now, I consider that to be in the best spirit of "homebrewing." Innovation, doing what had not been done before. Others mileage may vary...

Back in the late 1960s I was a staff engineer at a small
microwave company called Micro Radionics Inc. One of
the projects I worked on was a pre-flight test set for the
E6 Intruder. Battery-powered, it could be used on deck
in front of the radome to confirm that the E6's radar was
still operating properly. No specifications existed warning
of "megawatt" peak pulse powers from Intruder aircraft.

I'm not familiar with the EA6B and doubt it had "megawatt"
output powers. EW designed to interfere with receivers
generally don't need such high RF output powers.

> Living in an apartment, years ago I tried putting a 10 meter dipole across
> the ceiling in a stealth installation, I shut down when the residents above
> me complained that their tv would scramble while I tried running psk31.

In 1960 I was living in a second-story apartment and put
a short base-loaded CB antenna in the attic space about
five feet in front of the stacked TV "vee" antennas for
apartment dwellers, my own apartment included. The
2 W peak output CB had a 60 db minimum (measured)
attenuation (at Channel 2) lowpass filter. No problems
seen or reported. The TV transmitters in Los Angeles
were all grouped on top of Mt. Wilson, about 30 miles
away from the apartment.

A simple thing such as a lowpass filter can solve a lot
of problems before they happen.

Actually Megawatt Output Powers for Pulsed Radars are easily in the
range of most military Radars.......note I say "Pulsed" and not "CW"...

On the contrary, the 'clicker' persisted in some parts of the US railroad system into at least the 1930s. My wife's father had been a telegrapher with the Delaware & Hudson, and on joining the US Army for WW2 he was re-trained to International Morse. He spent the rest of the war still pounding brass, just doing it differently than before.

However, he didn't go back to the D&H in 1945, so others must determine exactly when the clicker did die out.

>None of the participants
> of any newsgroups were alive then and therefore none can be
> "witnesses" to corroborate methods of early telegraph reception.

Call the surprise witness...

Witness relates that sometime around 1962, she visited Knott's Berry Farm with her Dad, Mom and sister. This was back when it was a working fruit farm, which had expanded into serving home style chicken dinners and berry pies.

The family made a reservation for a chicken dinner, and because these were so popular, the Farm had to give visitors something to do while they were waiting for the second sitting. They hit on the idea of re-creating an authentic Western ghost town, correct in every detail.

So it came to pass that the whole family wandered into the office at the railroad station. There was the telegraph, clicking away... Dad froze in intense concentration, and then doubled over with laughter! When he got his breath back, he told Mom and the girls what the clicks were saying:

"Eat chicken dinners"

"Eat chicken dinners"

"Eat chicken dinners"

"Eat chicken dinners"

Witness personally affirms that the message was delivered through the clicking of the telegraph sounder.

Witness is now MM3YNW, and is standing watching me type this. Don't you all think she should learn Morse to continue the family tradition?

Pardon my ignorance, but what is a"slab plot"? It sounds
architectural.

Slab plots may not be the best term and it may be stack plots. Lets say
you have a plot of wave at time=o and another time=1 and so on. If you
stack these plots offset a bit using a transparent medium you can see
the wave as it decays over time. There's a good picture of this in the
Hewlett Packard catalog in the description of the HP 3561A. The folders
of Microsofts new Vista screen are a step in that direction.

What I described was PRIOR to 1900.

A few railroad carriers in the USA continued with manual
telegraphy until about 1960. But, in fairness to the
world of communications, those were rare.

The railroad system in the USA is not small and it is also
not the biggest carrier of freight over here. Outside of
the roll-on containers carried by rail between drop-off
and pick-up points, the majority of land freight here goes
by truck on our large highway system.

Most of the railways over here had begun converting to
data communications in various forms prior to 1940.

Knott's Berry Farm is a popular tourist spot in southern
California...relatively close to the original Disneyland.
It is roughly an hours' drive south from my Los Angeles

residence.

>So it came to pass that the whole family wandered into the office at the
>railroad station. There was the telegraph, clicking away... Dad froze

No doubt. The Knotts place IS a tourist attraction. But,
that reproduction of a railroad station is nothing more
than a reproduction. It is not a working communications
station. There are several railway station reproductions
in the Greater Los Angeles area and parts of them on
various motion picture production lots. Perhaps the best
one is on the north side of Griffith Park (closest to my
southern home) which is also a railway museum.

Knotts also has several buggies and a reproduction of an
"old west" stagecoach. Neither of which are used in any
public transportation outside of the park. In the motion
picture industry here (very big) there is a mild
contention as to which craftsmen build the "best
stagecoaches" (using modern materials having better
characteristics). Those can be made to "break apart"
safely for the cameras and stunt people riding them.
However, stagecoaches have not been used for public
transportation here for decades.

>Witness personally affirms that the message was delivered through the
>clicking of the telegraph sounder.

I have nothing against that. In nearby Anaheim, Disneyland
still has a flight to the moon experience (in Tomorrowland)
yet it never leaves the ground. One can also take a ride in
a "submarine" but not go more than a few feet below
the water's surface.

>Witness is now MM3YNW, and is standing watching me type this. Don't you
>all think she should learn Morse to continue the family tradition?

That is up the family suddenly thrust upon this (non)
discussion.

I was unaware that "wives and families" suddenly had some
impact on what is known about telegraphic communications
history in its half century before "radio" was demonstrated
as a communications medium.

I first "fired up" on HF in February 1953, part of my being
assigned to a US Army communications station in Tokyo. That
was a small 1 KW HF transmitter using TTY FSK. There were

three dozen other transmitters there; six more would be added by 1955. NONE of the radio circuits of this 3rd largest Army station used any OOK CW mode of modulation. In my subsequent career change after service into electronics design engineer I've never had a requirement to use OOK CW on radio. Until 2005 when my wife and I bought a new car having a keyless entry radio-on-a-chain-fob. That fob transmitter is OOK CW. But, its data rate is beyond human cognition, ANY human.

In 1969 my father and father-in-law were still alive. Both watched, in widely separated geographical locations (in the comfort of their homes), LIVE video from the moon as the first two humans stepped onto the lunar surface. Both my father and father-in-law were born in the year 1900... one year before Marconi's trans-Atlantic test radio transmission and three years before the Wright Brothers demonstrated the first heavier than air flight. Both astronauts plus Collins in the lunar orbiter were in constant touch with earth by radio...for both communications and telemetry, guided there by computers of several kinds, on earth as well as in the reentry and descent/ascent capsule.

I have nothing against telegraphic skills nor anyone using those for personal pleasure. However, in the light of advancement of the electronic arts, communications, radio, methods that ALL of us can share, I think there is an over-much emphasis by radio hobbyists on telegraphic arts. Manual telegraphy IS a historic first but it has been supplanted in practical communications means at our disposal...on land, in the air, on the sea, and in space.

I think we should be looking FORWARD to the future, not back to the past. Others disagree. I leave it at that.

>range of most military Radars.......

Actually, NO. "Most" are not at over one-megawatt
peak pulse levels.

Do the "radar equation" or just do the two-way free space
loss and then subtract the varying reflections of the
target (way NOT uniform). That gets a reasonable
approximation of power levels involved.

A long-range ship search radar has high power. It must
because it has to "reach" over the radio horizon. [more
loss due to refractive bending and scattering effects]

Intruders and Prowlers (E6 family) operate at altitude.
Their direct radio horizon is much farther due to that
altitude in comparison with a surface ship.

Electronic Warfare suites concentrate on copying the
enemy signal and returning it AS IF it were a target
return, either there or some distance away or on either
side. Only HALF the RF path is involved and the EW-
originated signal is quite low in level. Again, do the
"radar equation" but only the return path.

"Jamming" with over-much RF power went out with WW2.
It is much more subtle now and has been for years.
The circa 1958 MacDonnell Quail missle was a small
unmanned decoy air-breather with lots of automatic
radar futz-up on it. B-52s carried them then. I
worked a little bit on those at Ramo-Woldridge in
El Segundo, CA.

I'm also acquainted with the Association of Old Crows,
a professional one made up of those who work/worked in
Electronic Warfare. Try as I might, I can't remember
anyone there called "You." :-)

OK, let's get back to HOMEBREW things...

Can't help you with the slab plots or waterfalls,
but my Daqarta shareware has color spectrograms,
as well as spectra and waveform displays, signal
averaging, signal generation, etc.

FFT size is 1024 points, so you won't be able to use
this for tuning your guitar, if that's what you had in mind.
I'm in the process of adding a high-resolution
FFT peak position interpolator that might or might not
help that... it won't separate close peaks, though.

I'd be glad to answer any questions.

What exactly are you trying to do?

400mV isn't that far from line level going into a computer soundcard.
Is there a gain, volume, or full-scale adjustment you can make in
software that'll pull up the signal?

If you do need the gain, as others say a standard op-amp circuit will do
the trick. I've found the NE5534 to be a decent low-noise choice. Stay
away from the LM386; it's great if you need a bit of audio fast and
cheap, but that's about all it's good at.

Freight transportation professionals measure by the unit
of ton-mile. By that measure, rail is the #1 provider of US
freight transportation.

>   Most of the railways over here had begun converting to
>   data communications in various forms prior to 1940.

That's true. Some manual Morse telegraphy survived into the
1960s, but in general the use of teletype and voice comms
had become standard by the 1950s. Also, much of the need
for telegraph communications was eliminated by changes to
the dispatching systems in use.

>

IOW, it's OK with you if someone uses it, as long as they don't
emphasize it.

>   Manual telegraphy IS a historic first but it has been
>   supplanted in practical communications means at our

Morse Code is also practical communications. And it is widely
used in amateur radio today.

>   I think we should be looking FORWARD to the future, not
>   back to the past. Others disagree. I leave it at that.

What does "FORWARD to the future" really mean in that context?

Jim, N2EY

Hi Bob,

Why not? 1024 points (bins) has enough resolution to shake out every
note on a Hawaiian slide guitar. The only care is selecting the
sampling rate and most FFT packages should be able to resolve
exceedingly fine.

Yes, but not for exactly that purpose.

Here's a sample of my usage of Spectra:

Hi Hank,

Yes, I have. It is exceedingly expensive, but you can probably get 30
days of free use if you have a one-time knock off project. Of course,
it may take 30 days to figure it out.

FFT analyzers are a dime a dozen, but few know how to use them
accurately - or are even aware of what can be done with them. Bob's
complaint, notwithstanding, a 1024 bin FFT employing the proper mixing
inputs can resolve any note on a guitar to within hundredths of a
cycle. I am sure this is of no interest to you, however.

What are you trying to measure? The dime a dozen analyzers (meaning
free, or packaged with other software) can do enough if you are not
particularly demanding.

Over the years, the most useful FFT software I've had, is the (fairly simple) FFT analyzer in Audition/CEP. It's big plus is the ability to use the Audition/CEP audio editor to select portions of real-world waveforms, and to use the wave generation and modification features to create waves for use in analysis and testing.

Hi Arny,

I am sure this is an useful tool, but without windowing the data, any
semblance to reasonable analysis is a house built on sand. I note in
your provided link to work you have done that you use Blackman
exclusively. This is at least a good first pass to achieving an
analysis, but any variety of work is going to be more demanding (the
Blackman window has its limitations), otherwise it is like looking
through glasses smeared with Vaseline.

Is this a moderated newsgroup?

Are you the moderator?
>
>   This newsgroup is for experimentation and building
>   radio-electronics in the home workshop.

Really?

The post of yours that I replied to contained comments
on the railroad system, landline telegraph communications,
Knott's Berry Farm and other tourist attractions, stagecoaches, wives-
and-families, your lack of use of
Morse Code in military communications, your parents
watching the lunar landings on TV, and keyless auto security systems.

I don't see a single word from you in that posting
about "experimentation and building radio-electronics
in the home workshop."

It also contained this personal policy statement from you:

"I have nothing against telegraphic skills nor anyone using
those for personal pleasure. However, in the light of
advancement of the electronic arts, communications,
radio, methods that ALL of us can share, I think there
is an over-much emphasis by radio hobbyists on
telegraphic arts. Manual telegraphy IS a historic first
but it has been supplanted in practical communications
means at our disposal...on land, in the air, on the sea,
and in space.

I think we should be looking FORWARD to the future, not
back to the past. Others disagree. I leave it at that."

Sure sounds like you were having a policy discussion
to me!

Does anyone have a guess what value choke L112 found here
http://www.ppinyot.com/hammarlund.htm#Power%20Supply%20Choke
might be? I am getting a 190 ac volt drop across this puppy. It has a cold DC resistance of 97 ohms. How I got there is also explained at the hyperlink page above.

The short of it is, the negative bias voltages are down across all associated tubes that share that supply. Google is no help.

Even a guess at this point would be nice. I have never calculated a choke in this configuration before.

Amy, Bob, Richard
Thanks for your response and interest. I'm retired used to be an
engineer
before management laid waste to that. I've started taking weekly guitar
lessons over a year ago and slowly getting a bit better. It's a hell
of a challenge at 66. I want
to buy a better guitar and all guitars don't sound the same, even the
same model. One shouldn't expect them to because they're all made from
different cuts of wood and assembled by human hands. What amazed me is
that the materials used for the nut, neck, saddle and bridge as well as
the mfg and age of the strings have a noticeable effect on the sound.
The bridge pins, angle of the strings out of the bridge pin holes and
tuners also have effects.
In the last year I found at least four guitars that I really liked, 3
used ones and a new one all over a $1000.00 but I passed because I'm not
that impulsive or flush with cash. A good player can make just about
any guitar sound good, or a hell of a lot better than me.
I'm into ham radio also and last year at hamfest I traded for an HP
3582A spectrum analyzer but the learning curve is a bit steep for me.
So unless I can find an experienced user or devote much more time to it
I'm going to have to trade it.
Last week I won an HP 3561A on ePay but it has a problem that I hope I
can fix. In the meantime I thought it might make sense to scope out
sound cards and related software. I know a lot of hams use sound cards
for various & different applications and it's about time I took a wack
at one and what better way than trying to figure out what it is that
makes one guitar sound so much better than another. Or if changing the
nut, saddle or bridge pins really improves the sound or is it just
wishful thinking.
And I can make use of it for ham radio weak signal detection and
analysis.
I used a term; slab diagrams which may be known as stack diagrams. I'm
interested in watching a plucked and later chords as they decay over
time in sort of a 3D plot. There's a good example of what I'm looking
for in the HP catalog describing the HP 3561A.
tnx

The phase transitions will use bandwidth too.

We already know the power spectral density of PSK31.
What is the power spectral density of your proposal?
Numbers, please.

Well of course any phase transitions will use bandwidth, but 1800 0.1 deg transitions spaced out over 1/2 bit-time will will use less than a single 180 deg instantaneous transition, so it should be bandwidth-conservative. I don't have the numbers (perhaps some of our more mathematical colleagues can comment), but I'm sure the result will be a reduced-amplitude set of low-order sidebands traded off for additional low-amplitude higher order sidebands. My question wasn't whether the modulation would use less bandwidth, but whether it would 'work' at the receiving end.

Just some thinking out loud (or maybe its finger
thinking).
1, Problems with chokes are usually either open windings,
shorted windings, or shorts to the case or core. Open
windings result in very high resistance or a completely open
circuit. Shorted windings result in lower than normal DC
resistance and lower than normal inductance. Shorts to the
case or core can be checked with an ohm meter. One can also
get high resistance "shorts" resulting in leakage from
winding to core. This is best tested using a special very
high resistance ohm meter. In any case, it does not sound
like you are having any of these problems.
The HX-50 appears to have three supplies, a high voltage
supply using the 5R4 rectifier with plates connected to the
outer windings of the xfmr, a low voltage supply using the
silicon diodes connected to the inner windings, and a
negative or bias supply using a single silicon diode
(CR-106) connected to the tap on the winding. If your bias
voltages are down but the B+ voltages are about normal I
would suspect the bias supply. Its possible the diode is bad
but they usually go either all the way open or all the way
shorted. A multimeter will check it. I am more suspicious of
the filter capacitors, C-176, C-177. Its also possible that
something has happened to R-168, the current limiting

resistor, or, perhaps one of the other resistors.
I wonder if anyone has a cross-reference between
Hammarlund part numbers and their specifications. I ran
across a web site that has a cross-reference between "old"
and "new" H part numbers, perhaps there is somesort of
catalogue there. I haven't looked. It would be useful to
know the inductance of L-112 and its DC resistance. The
inductance being off would also be an indicator of problem.
Again, if its the bias supply that has the problem I think
the choke is a red herring.

What a neat project!

I can tell you, based on years of experience with changing out the parts
that you mentioned (nut, saddle, bridge, pins, ESPECIALLY break angle)
that these things DO make a difference in the sound. I have NOT heard a
difference with changes of neck or tuners (certainly these things affect
the intonation of the instrument, but I've never known then to change
the quality of sound).

However, the choice of wood, body shape, and top bracing are far more
relevant. You might want to check with Martin, Taylor, Larrivee, et al

to see if they have any scientific info that can help you. They aren't in the business of pushing pins, tuners, etc.

Good luck and please post what you find out!

(Since this is RAO, I should point out that my hearing of the things mentioned in my second paragraph above is based on differences heard based on changes made to the instruments when it wasn't possible to know about the changes.)

Jenn
The neck wood affects the sound energy as it goes from the nut vibrate
the guitar and so does the truss rod. Tuners can influence the sound
because their weight can dampen vibrations. An interesting thing is to
hold a tuner lightly (or the headstock) when
you pluck a string and feel the vibrations.
A good analysis should be able to detect loose bracing and you should
also be able to see the effects of scalloped bracing.
I shotgunned this query because I didn't know where I would find the
most help. If responders can suggest a group I could limit it and not
waste time of those who aren't interested.
I've also made unconnected posts to other groups, but have less interest
and reponse so far.
I didn't post to any guitar groups because most there are musicians that
don't need this kind of crutch and have an ear that's been trained for
many years. I want to see if I can catch up by being able to see.
In addition it should be helpful in voice training which I also need
because I'm trying but with less success to sing.

The problem is that the line resolution of an FFT is the sample
rate divided by the number of time points. So with 44100 Hz
sample rate and 1024 points you get a bit over 43 Hz per line.
So the first non-DC spectral line would be 43 Hz, which is about
a low F on a bass guitar, and the very next line would be the F
an octave above that... you'd miss an entire octave!

The standard musical note frequencies (semitones) differ
from each other by about 6% (12th root of 2, since there are
12 notes in an "octave"). But you need much better
resolution than this for tuning, typically a "cent" or so,
namely 1/100 of a semitone or .06%. At 43 Hz that
works out to about 0.026 Hz. A 64K-point FFT
at 44100 Hz will have a native resolution of 0.67 Hz,
which still isn't good enough... but at 64K samples,
you are looking at 1.48 seconds of sound. If the
pitch changes over that interval, the spectral peak
will be smeared even further.

If you attempt to beat this game by going to lower
sample rates, note that frequency resolution is
still proportional to the inverse of the total sampling
interval. So if you tried to use the 1K FFT but sample at
44100 / 64 = 689 Hz to get the same (inadequate)
resolution as the above 64K FFT, you'd still need 1.48
seconds of sound. Sound cards don't sample that
low intrinsically (typically 8K lower limit, 4K on old

Sound Blasters), but you might manage using sample
rate conversion (either Windows or sound card built-in).
I haven't tried this, but I suspect that it would not be a satisfying
experience due to the s-l-o-w time response.

Yes, you can easily resolve to 100ths of a cycle, but not from
a native FFT. (See my other response.) You can do it from
the waveform by measuring the time between cycles. That's
one of the methods I'm working on. The other is to do it from
the FFT via peak interpolation. The waveform method will
be very accurate with simple static waveforms, but I expect it
will have trouble with the 2nd harmonic of a plucked string,
which is not an integer multiple so "rolls" through the waveform.
The FFT interpolator will not have the same raw accuracy, and must
have absolutely separated spectral peaks since it assumes the
one it's interpolating is the only one. I'm not hopeful it can be
made good enough to tune a guitar, at least not in the bottom
octave where the harmonics land on adjacent spectral lines.

The choke has AC going through it, since it's on the input side of the rectifier. My guess is that it's not just a normal choke but is a swinging choke with a controlled saturation characteristic. It's acting as a current regulator; as current rises the magnetic flux in the core rises and at some point the core saturates and the impedance of the winding shoots way up, reducing the current flow.

A 190V drop across it might be normal, or it might be a sign you are trying to pull way too much current through the thing. What voltages do you measure across C162 sections A and B? They should be fairly close to the maximum capacitor ratings, I suspect. If they are within a reasonable range, I'd say the swinging choke is fine, otherwise I'd suspect something is on the secondary side is pulling too much current and it's hit the wall.

If it IS failed, Peter Dahl can probably rebuild it. You won't be able to just drop in something off the shelf, and sadly design of saturable reactors and magnetic controls and amplifiers is a lost art today.

Jenn apparently thinks that the changes in SQ that come from modifying the working parts of musical instruments are fully comparable to say, adding one more strand of wire to a speaker cable composed of finely stranded wilre.

So you think that Spectra doesn't provide options for windowing and/or that
I have no idea what effect they have on actual results????

But that is exactly backwards from the way chokes work. As the current
rises, and the core approaches saturation, the coil starts to lose the inductance
enhancement provided by the core, and it approaches the inductance of an
equivalent air core choke. That is, the inductance *drops*, and the inductive
reactance *drops* and the AC current shoots way up.

Hi,

I checked the L112 choke in my HX-50, and it is 75 Ohms d.c. resistance.
That is in the ball park of your 97 Ohms measurement.
That same choke also serves as the high voltage choke,
since it is in the common center tap return for the medium voltage
and H.V. taps as well as the bias tap.

In standby, I measure 195 VAC across the choke.
So, it sounds like your choke is innocent of the low bias
readings.

Have you put a scope across the bias supply capacitors C176 and C177?
They may need changing out if there is excessive ripple.
The 680 Ohm resistor in series with the bias supply may have increased
value.
Did you check the value of R142 and bias adjust pot R143? They may be
dragging down the bias voltage.

You might measure the bias voltage with the 6DQ5 final tube removed.
If the tube is gassy, it would tend to put a + voltage
on its control grid, which may be working backward
in your bias supply, making the supply less negative.

73,
Ed Knobloch

True; I was thinking of the neck shape. The question is, of course, can
one hear the difference between different neck woods on the same
instrument body.

> Tuners can influence the sound
> because their weight can dampen vibrations.

But can one hear the difference between different tuners? I seriously
doubt it.

> An interesting thing is to
> hold a tuner lightly (or the headstock) when

But can you hear the tone quality change as you hold the tuners? I
can't detect that difference on any of my instruments.

> A good analysis should be able to detect loose bracing and you should

Indeed.

If you go to rec.music.makers.guitar.acoustic, you'll find several
outstanding luthiers there who may be able to offer help. And though I
don't hang out there, rec.music.makers.builders might also include
similar folks.

Good luck, Hank!

I doubt very much that L112 is faulty. The bias supply
capacitors, rectifier and resistors are much more likely
to be bad.
>

> The choke has AC going through it, since it's on the input side of the
> rectifier.

No, it doesn't.

It has pulsating rectified DC going through it.

There are two reasons why it is in the center tap lead:

1) All the power supplies can share it

2) Insulation requirements are less.

>My guess is that it's not just a normal choke but is a swinging
> choke with a controlled saturation characteristic.

Agreed.

> It's acting as a
> current regulator; as current rises the magnetic flux in the core rises
> and at some point the core saturates and the impedance of the winding shoots
> way up, reducing the current flow.

Not exactly.

In a choke-input filter, the inductance must be above a certain
critical value or the filter isn't really a choke-input filter.

This critical value (called critical inductance) is directly related
to the total load resistance. The lower the load resistance, the
less inductance is needed. The load resistance is just the output
voltage divided by the total current delivered by the rectifiers.

In a transmitter, the load resistance and current vary
all over the place with keying, modulation, loading, etc.

The inductance of real-world iron core filter chokes depends to a
certain extent on the direct current through the choke, which
magnetically saturates the iron. One way to reduce
this effect is to include an air gap in the iron core. The wider the
gap, the less the inductance variation. But such
a gap reduces the overall inductance.

If a choke with constant inductance were used, it would
need to have enough inductance for the lowest-current/highest load
resistance condition, yet enough current
capability for the highest current condition. That means a wide air
gap. Such a choke would be large and expensive.

Instead, a choke with a narrow air gap is used, Its inductance
varies with the current - more inductance with less curren,
less inductance with more current. This is exactly what is
needed with a choke input filter. Such chokes are called
"swinging chokes".

The power supply for my 150 watt homebrew rig uses a swinging choke in
the high voltage supply. This choke has 25 henries inductance at 30 mA
DC but only 5 henries inductance at 300 mA DC.

>
All of the rectifiers, filter caps and resistors in the power supply
section are suspect. This is particularly true if any
selenium rectifiers or carbon composition resistors were
used.

Crap, another post from the same morning before breakfast! <blush>

What I meant is that the differences that I heard after changes in the
instruments were heard without me knowing that changes had been made.
Thus, there was no "listener bias", a favorite topic around here at
various times.

Whatever Arny is blathering about, I have no idea.

>I have no idea what effect they have on actual results????

The designer of Spectra is a local Ham - I know his capabilities, I
don't know yours. All I have to go on is the pedestrian choice of
Blackman windowing that demonstrates nothing in the way of "ideas on
the effect on actual results." As I offered, it is an ordinarily
suitable choice if you have no demanding requirements.

Hi Hank,

There are a world of free analyzers, one quick search found 16:
http://freshmeat.net/search/?q=fft&section=projects&Go.x=11&Go.y=10

Get your feet wet before throwing the green at bloatware designs that
invest their resources in advertising. If you find nothing in this
first list, I can certainly 26 find more.

I got it now, I'm dealing with a FFT snob, not someone who just sees them as
a tool to get a job done.

> bias", a favorite topic around here at various times.

OK, since I'm dealing with a member of a lesser species, I'll spell it out:

As a rule, changes in the mechanics of musical instruments have relatively gross effects, compared to the sort of things that many high end audiophiles fret about.

> Whatever Arny is blathering about, I have no idea.

Yup, much of what I write is over the heads of members lesser species.

>a tool to get a job done.

Connoisseur is more appropriate, and as for getting the job done, I
did that on contract to HP for one of their many FFT audio analyzers
22 years ago. I've written 200,000 lines of fourier code for many
products that get jobs done.

I also have the seminal work by Blackman and Tukey that predates the
math of the Fourier transform: "The Measurement of Power Spectra."
An extract bears repeating:
"'... we were able to discover in the general wave
record a very weak low-frequency peak which would
surely have escaped our attention without spectral
analysis. This peak, it turns out, is almost certainly
due to a swell from the Indian Ocean, 10,000 miles
distant. Physical dimensions are: 1mm high and
a kilometer long.'"

The Hann or Hamm windowing functions are preferable as even Blackman
would admit and even these two are hardly exemplars of outstanding
performance. My designs exhibited a noise floor of -200dB
(statistical noise from the transcendentals' math). A poor Blackman
window would throw away 120dB of that to offer only -80dB. -80dB is
certainly impressive to mundane applications, but most would agree
that very little more effort was needed to gain 12 more orders of
magnitude in performance.

Hi Hank,

If you've waded through my prior list of freely available Fourier
analyzers, more can be found at:
http://sourceforge.net/search/?type_of_search=soft&words=fft
Not all are applications however.

However, you should probably try to get a copy of HP's Application Note 243-1 "Dynamic Signal Analyzer Applications." Of particular note for your studies into the nuances of investigating construction materials in Guitars (I did it with Violins), you should study the Fourier math relating to "Coherence" suited for a dual channel analyzer.

inherent explanation here.

586. 813's as Modulators

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-02-21 12:27:51 UTC
From: Jack Schmidling <arf@mc.net>
Message-ID: <12toem5go4rou40@corp.supernews.com>
Source record: 8425

My new (first one in 50 years) is an 8000 modulated by a pair of 813's running as triodes. The RF deck and Pw supply are up and running and I am working on the modulator now.

My plans are to drive it with the Ranger and eventually do a stand alone audio section. The Range gets poor audio reports in spite of months of trying to resolve it.

I am wondering if anyone here as any experience using 813's as triodes and would also like some help on the audio driver.

I bought a little solid state audio pre-amp and driver that puts out about 4W at 8 ohms. This is probably not enough to drive the 813's so I need more poop and some ideas on how to drive the modulators with the 8 ohm amp.

There are some in progress pics of this project at
http://schmidling.com/radio.htm

On DC, they can't! No way, no how.

On AC, a choke can limit the current by being a reactive component...
kind of a lossless resistor for AC.

But! Swinging chokes always reduce their inductance when the current
rises. They typically have a 100:1 change in inductance over their
design current range.

GM Mac, all the time! In a shop environment, not as an RF preamp on the air since I don't have any need for that. I use an INA 02186 (roughly equal to the MAR 8), to depress the noise figure of an old HP 312 selective Voltmeter when I need it, Also MAR 4 to boost a DDS output that runs 7-35 MHz.

Unless you're running a very inefficient antenna, you shouldn't need a preamp for anything 2-30 MHz with any reasonable receiver. I HAVE used the above INA 02186 for a beverage antenna amplifier. Not for myself but for a friend with a 500 foot beverage. Worked fine.

Right, but I was thinking that in the position where that coil is in
the circuit, it's directly in series with the AC coming off the transformer.

How does the reduced inductance translate to higher series impedance?

Why must people flame and call names? Bill Turner is technically
correct, although severe. Al's post is off topic, but it is polite
and sane. He shows no sign of being an "idiot" or jerk. An off topic
post like that perhaps should be handled by giving a few polite
answers, reminding that it is off topic, then dropping the subject.
On topic now, I suggest to those that believe that they cannot learn
code learn it anyway. There will still be code on the air, at least
for a time. Take your short-wave sets and listen to it. I disagree
that you should not memorize code. Learn the "A" is .- ; "B" is -...;
etc. There are only 26 characters plus ten numbers, and a few
punctuation characters. Man, if you can get a Master's in EE which
requires advanced mathematics with all the associated arcane symbolism
then you can memorize a little code. Of course, by counting dots and
dashes you'll never get past a few wpm, but you continue to listen to
faster and faster code, and as was mentioned above listen to
characters played very fast but with wide spacing, which will help you
to learn by pattern recognition. When you master that, you will

listen to code as a sort of "language".

Here is an example of my second biggest peeve of these groups (the first being spam). It's ego posts. LenAnderson seems to be intent on demonstrating that he is the final authority; with an encyclopedic knowledge of all he is typing about. And a few put-downs here and there. Example: Ken Scharf made an interesting comment: "Also as sent over the land line the operator had to listen for the gap between clicks NOT the sound of the clicks! Try that folks!" Professor Anderson had to reply with: "Irrelevant as to what any telegraph operator did prior to
1900...except for historical notation." I applaud Ian White for his gentle rebuttal of Anderson; but of course "Professor" Anderson cannot be treated in such a manner. But I liked Jim, N2EY's "comeback" better. Even though it was a bit off topic, this was a nice discussion before the history lessons. I love history and I believe that it is extremely important (under taught) but I perceive that the spirit here was not to teach and inform. I am rather new to these google groups, usually not having to time to sit here sorting through posts and typing in some myself. But I have recently become somewhat disabled (military service). I have a life-long interest in vintage electronics, collect short-wave radios, and designed and built my own receiver. I came to these Google groups looking to receive and to share. It is distressing to witness ego flare-ups. Does this happen often here? I've seen it a few times on other groups, and on Yahoo.
Say, can anyone point me to some information on creating my own filter chokes? Is there a source that anyone knows of for silicon-iron core plates? Thanks
By the way, I despise flaming and I came a bit close to flaming Anderson, but couldn't help but say something about a monologue like his.

It doesn't.

Where did you get the idea that such an inductor exists?

A swinging choke aids in the *voltage* regulation of a choke input
power supply by having a high inductive reactance at low currents (where the
supply would tend to be too high in voltage), and having low inductive
reactance at high currents (where the supply would normally tend to droop.)

Is that what you are thinking of?

-Chuck

Ahh! So the increased current causes the inductive reactance to drop,
causing the series impedance to drop. That makes sense, so long as the
source impedance is the same all the time, right?

If the source impedance changed, it could either help, or hurt the process.
It would all depend on how it changed. But I would expect that for the
usual diode, and transformer combination, the source impedance should be
pretty stable.

For a swinging choke to work, the power supply must be choke input. It
is necessary that the choke see the massive AC ripple that comes out of
the rectifier. No ripple, no regulating effect from the reactance.

The problem seems to be that they have a lot gain (especially MAR-8
with a huge gain below 100 MHz), not so spectacular output intercept
point, thus the input intercept point is quite low, which can cause
problems, if a broadband antenna signal is fed into it.

Even if you have sufficiently selectivity in front of the MAR, you
have to watch out for leakage capacitances around the filter, since
the amplifier has gain well into the VHF and UHF bands.

I once tried to use a MAR as a preamplifier for the 29 MHz satellite
band with a filter in front of it that I hastily, but since I have a
few FM-BC stations (100-200 W each) and VHF and UHF TV transmitters (a
few kW each) at 1-2 km distance, I got quite a lot of intermodulation
products from these on the 29 MHz.

So even if you are making a filter for HF, you still would have to be
careful about stray capacitances in the coils and stray inductances in
the capacitors, in order to keep the strong VHF/UHF signals out of the
MAR input :-).

Try to locate the HAREC (T/R 61-02) recommendation from www.ero.dk

At least previously, the annex contained a list of how the national
various classes are mapped to the HAREC recommendation and
requirements. At least you can get the names or code names of the
national classes, which would help in googling for the actual national
classes.

The T/R 61-01 recommendation on the same site might also be helpful,
but less accurate.

As far as I know, there is no central registry for requirements and
privileges, each country will interpret those two recommendations in
their own way.

For power levels, the only international recommendation that I know,
is the CEPT recommendation of 1 Werp at 135 kHz band, which due to the
very low efficiency of any antenna of reasonable size, allows
transmitters powers in the order of 1 kW in practice.

OK, in that case, the answer is NO. They haven't made an MMIC with the characteristics of IK4AUY's preamp. Not even in the same zip code as the characteristics of his pre-amp.

>knowledge of all he is typing about.

If that is your perception as "the truth," then I submit
that "truth" is not correct.

REC.RADIO.AMATEUR.HOMEBREW is chartered for designing,
building radio equipment in the hobbyist's workshop; i.e.,
away from work in radio-electronics. You can read the
FORMAL definition of it all you want and not come away
with a much-different opinion.

What seems to be at question is whether or not KNOWLEDGE
should be shared. Plus, who is the "qualified" judge of
such knowledge. I've never claimed to be any ultimate
judge or lawgiver of historical data. However, I've
accumulated a number of decades of both professional
(paid for services) and hobby experience (no pay for
anything unless negative money outflow is a value) that
stretches back to 1947. It is my personal opinion that
radio-electronics is a totally-fascinating field of
technology...so much so that I changed my career goals
in life to electronics engineering after release from
my US Army service. I've never been disappointed in that
decision.

NO ONE here has any life experience in anything (including
telegraphy) prior to the year 1900. ALL that any of us
have for information on such long-ago times is historical
descriptions. One of the problems with such historical
information is WHO (or which organization) wrote it. An
example is "morse code." Samuel F. B. Morse's "code" was
originally all-numeric. That included the famous first
message communicated by the Morse-Vail Telegraph Company
from Washington, DC, to Baltimore, MD, in 1844. Morse's
financial "angel" to the development of the telegraph
system was the Vail family who got their money from rail-
way equipment building. Alfred Vail would, according to
the Vail descendents' website information and several
other sources including the Radio Club of America, later
suggest changing from an all-numerica code to one which
included representation of the letters and common

punctuation of the English language as well as Arabic numerals. This was pivotal in the success of the Morse-Vail telegraph system since, in effect, the code could be generated-sent-received and near-immediately transcribed into a common language.

There was no need of phrase books to translate phrases and words into a numeric code, then re-translate it on reception. But that was only the second of two innovations. The real first was described in the Morse-Vail Telegraph Patent as the "relay." That relay was quite similar to what is in wide use in electrical and electronic equipment today...a 'sensitive' (low-power) electromagnet mechanically and magnetically coupled to an electrical contact. That contact could substitute for the transmitting key/switch and thus power a second telegraph line through a local battery and extend that telegraph line farther than the original circuit. Up to three such relays could be used given the technological limits of early electrical apparatus. It is my opinion (not "ego") that the telegraph Relay was the primary key to the success of the Morse-Vail Telegraph system. That basic telegraph system spread throughout the world during all of the later 1800s.

Let's consider INNOVATION and its relation to "radio" and this morse code. The first radio-as-a-communications-means was demonstrated in 1896, in Italy and in Russia. Morse code was used in the on-off "radio wave" switching. Why that? For one thing, that on-off code was already so mature (52 years) and widespread that many "dialects" of that representational code existed worldwide. Early radio was so technologically-primitive that simple on-off switching was the only PRACTICAL means to communicate. On-off switching. That is what the Morse-Vail Telegraph used in its RELAY contacts. The only technological difference was that "radio" eliminated the wires using electromagnetic wave propagation to carry the communication. That was a revolutionary step for mariners and quickly adopted. They could now 'signal' beyond the visible horizon, something they were never able to do quickly before this revolution.

But, in the midst of this revolutionary step of over-the-horizon near-instant communications, the Mythos developed about the Mode of "morse." Few could grasp the basic principles of this new "radio" but they could identify with the human-sensed on-off patterns and seeming magic of the patterns translatable to human-understood speech. Was the morse code the essential element to success of early radio? Not precisely. Those early damped-wave

(spark-induced) "RF generators" and the gigantic rotary alternators (operating at VLF) were still turned all-on or all-off. What was essential for the speed of early radio was in using an on-off representation for the characters of a written language. The Morse-Vail Telegraph used English. They were the first success even though many had tried by various means prior to 1844. Had someone else in another country (and other language) been first and innovative enough, the name of the code could have been entirely different.

Innovation. Sometimes a necessity in hobby work. Some parts may not be available yet their type would enable simple operation and building. The hobbyist must innovate to find substitutes. Sometimes that can be done by others and thus worthy of spreading information around. That's what newsgroups like this are good for...informing others of something useful in the hobby of designing-building-repairing of radio-electronics.

Yes, there ARE diversions in this newsgroup into non-hobby subjects. Especially so in the USA amateur radio "revolution" of the elimination of morse code testing for a US amateur radio license. Many are emotionally wounded by that decision but that is just unfortunate for them. Progress goes on, innovation continues, the technology and ways to use that are evolving, changing. But, some want to "rewrite" history (or selectively use certain parts while omitting other parts) to make their own personal point about something dear to their hearts. James Miccolis is one of those over in RRAP. He has an archived decade of experience in "correcting" others in RRAP who do not agree with his one-sided views of amateur radio.

For my part, I like to contribute information on designing-building-repairing of radio-electronics. I try to be accurate when doing so. No, I'm not presumptuous about "knowing everything" since I don't. I'm still learning things and eagerly do that...in between trying to keep up with the constantly-changing-state of the electronics art. We are all diverse and many of us in here come from differing occupations involving electronics. Yet I think that ALL who really like to get involved in the technology of radio-electronics DO want to contribute when we can. It IS a fascinating field of technology.

>By the way, I despise flaming and I came a bit close to flaming
>Anderson, but couldn't help but say something about a monologue like

>his.

"Flaming" happens. It is the nature of the beast.
You've already done what you despise but that doesn't
bother me. After 23 years of doing computer-modem
communications, I've seen much worse. :-)

"Monologues?" :-) Yes, others get that impression.
Sometimes one has to spend time "connecting the dots"
(so to speak) in order to prove a point to one-sided
others. Note: Explanations sometimes require more than
three sentences in a paragraph. I was influenced by the
enjoyable PBS series "Connections" by James Burke. There
is a huge MASS of inter-related technology that has been
developing among humans for centuries. I think it worthy
to examine as much of that as it applies as possible.
Others do not. <shrug>

Let me re-phrase that Mac, there's not an MAR that will match the performance of the IK4 amplifier. RF Microdevices however, makes an RF2317 linear CATV Amplifier that if you operated two in push pull would probably make it. You'd wind up with under a 5 dB noise figure, 15 dB of gain and an IIP3 of +35 dBm. (Output Ip3 >+50 dBm!)

The power requirements are not insignificant, a single one requires 9 Volts at 175 mA. a pair, 350 mA.

What size? Do you mean the type commonly used in
hollow-state gear - several henries at a couple of dozen
to a couple of hundred milliamps, insulated for hundreds
or thousands of volts?

If so, there is some info in older ARRL Handbooks and
in older versions of "Reference Data For Radio Engineers".

I can look up some details if needed.

> Is there a source that anyone knows of for silicon-iron

aka laminations

I googled "silicon iron transformer laminations" and found
a lot of stuff. Take a look. But I suspect that they may be
geared to production quantity orders.

One common source is the power transformer from an
old microwave oven. These are often welded together,
rather than bolted, and it may take a bit of work with a grinder to
get the core apart.

If I have my numbers right, a peak envelope power of 1500 watts equates to a carrier power of 375 watts, which requires an audio amplifier to put out 200 watts (to round up a bit).

If the 813's were wired as pentodes they could deliver 600 watts in AB-2 with less than a watt on the grids. I'm not at all sure of what you'd lose using them as triodes, but I'll bet they'd deliver 200W in AB-1 with no grid power consumed at all.

Antique Radio Supply (www.tubesandmore.com) has a reprint of an RCA transmitting tube handbook that has extensive data on the 813 -- it should have enough data in there to figure out the design stuff, and directions in the front on how to use the data.

Hi Bob,

What you describe here, and that which followed, is a problem of
either hardware (I design my own) or a perception of Fourier
techniques that is constrained to common applications.

The trick is one that is encountered quite commonly with RF designers
(and those Hams that actually practice the craft instead of being
appliance operators) - it is called mixing. Or to describe it with
more precision (as an audio crowd has a restricted meaning for the
term "mixing") heterodyning or modulating/demodulating. Simply put,
the data channel is pre-processed by multiplying it with a reference
cosine before being passed onto the FFT. (Although this sounds like
windowing, it is not.) Of course, the output of the FFT has to have
its units recast. In the old days, this was called "zooming" or an
arbitrary view of a single frequency encompassed by a span of far
higher resolution than that obtained from a simple transform. I would

quickly point out that the simple transform is still performed (same bin interval, same bin count), but it has been augmented.

This technique, plus a waterfall display, is useful in tracing down mechanical problems in journals, bearing races (with bearing run-out or ball defect) and bad gear meshes. It also relates to Hank's desire to test individual construction components in the guitar as all of these problems relate to a subtle data inflection that can be destructive in machinery, or discordant in music. The zoom feature can reveal these defects with remarkable resolution. As I said, the FFT as originally described can differentiate every note of an Hawaiian slide guitar. Perhaps I should have added the proviso: provided you use a synchronized tracking generator for mixing. However, given this can be done digitally (no one needs a hardware oscillator), no change in hardware is necessary. All the data that is needed is already there.

> www.daqarta.com
by the way, this seems to be a dead link. (later) I take that back, but it took a lot of retries over the span of an hour.

Further, it seems you have a lot of what I mention above covered in your pages, by parts, but none of them encompass the whole of "zooming."

And for your page on windowing, drop me an email if you would like to see some pascal routines embodying some very tight windows. These came from my time with HP whose chief engineer soon after departed for a chair at some eastern university.

My sole experience is using them not in triode mode, but in pentode mode. The RCA specs tell about using a pair in AB1 as a modulator. Specs here:

http://www.mif.pg.gda.pl/homepages/frank/sheets/079/8/813.pdf

In triode mode (plate connected to screen) you'd be limited to 750 volts on the plate if you follow the spec sheet religiously, which will really hurt you in terms of AF power ability. I'm guessing that a pair of 813's used this way would not put out more than 120W of audio power. Many beam power tubes will take more volts on the screen than the spec sheet will say without arcing over but I cannot tell you about this mode on an 813.

In pentode mode you have to do a fairly stiff screen supply (which you might have elsewhere in your line-up). Don't forget the -80V or so grid bias too.

The "classic" way of doing all this is with a pair or maybe two pairs of 811A's, which are zero-bias as a class B modulator. You can easily get 250W of audio out of a pair or 500W out of two pairs. Driving power isn't zero but it's very moderate (less than 10 watts).

The tubes for all this is easy - but you've got a modulation transformer lined up already? Choosing impedances to match that transformer is probably more relevant than any dickering about tubes.

Tim.

Richard:

Thanks for your detailed post. I am aware of the "zoom"
approach, but have not implemented it yet. The cosine
multiplication down to baseband is the easy part; the part
that has put me off is the pesky decimating filter.

For others reading this, the basic idea of the zoom FFT is that
if you want to "zoom in on" some frequency region at
higher resolution, you multiply the incoming signal by the
center of the desired range. From that old high school
trig formula for the product of sinusoids, you get a bunch of
sum and difference components. So the center of the
target band ends up at 0 Hz since you multiplied it by a

sinusoid at the center frequency, and all the rest of
the original spectrum is now spreading out on either
side of 0. Now, if you low-pass filter this mess you can
re-sample it at a much lower frequency. The filter has
to be set so there is nothing of significance above half
of the new sample rate, just as for the orignal ADC (or
you get aliasing errors).

Then you take an FFT of the same size (1024 or whatever)
samples, but at the new lower sample rate. If the new rate is
1/100 of the original, the resolution of the spectrum is improved
x100. Another way to think about this is that if you only wanted
to zoom in on the low end of the spectrum, you wouldn't need to
do the cosine multiply, filter, or resampling... you could just reduce
the base sample rate to 1/100 (if your sound card permitted, and had
its anti-alias filters set for that) and get exactly the same results.

Note that this gives exactly the same resolution as an FFT that is
x100 larger, where you only get to see 1/100 of the whole spectrum.
Also note that an x100 increase in resolution takes x100 increase
in sample time, so you must insure that the signal is stable over that
interval or you will get spectral peak smearing... there is no free
lunch here! This is no problem for Richard's examples of bearings
and gear meshes, but I'd expect troubles with most music since
it is so dynamic.

Anyway, back to my original lament: The low-pass filtering and
resampling would be quite inefficient if done by conventional
approaches, but there are apparently some elegant solutions
that do both functions in one block, reusing it over and over
to get successive halvings of the sample rate. My problem is
that I have only seen this described in theoretical terms with
simple block diagrams, leaving the exact coefficients, etc, as
"an excercise for the reader". Searching the Web I find that
others are apparently as left out in the cold by this as I am,
and there is no example code, hints, or tips to be found.

So, until this particular reader either gets struck by a flash
of insight or takes the time to read up on this enough to
get a whole lot smarter, the zoom FFT is on a back burner.

(Richard, I'll Email you about those window routines...
many thanks for the offer!)

Best regards,

Bob Masta

Okay, wait a second.

You're talking about a configuration where the choke is seeing both AC
and DC on it, and both are required for regulation. The impressed AC
is modulated by the DC, correct? As the DC voltage changes, the inductance
changes, so the reactive part of the impedance changes and the AC voltage
changes. Do I have that right?

I was thinking about a configuration where the choke sees entirely AC,
which would be a different thing altogether, like you see in arc lamp
power supplies. I thought they worked the same way but it's clear they
don't.

Andy writes:

I've been using Lewallen's EZNEC for about 10 years on my
laptop whose operating system is Windows 98SE with no
problems..

I just got a new computer with Windows XP Home Edition.
EZNEC installs fine, and several of the features work, but when
I try to do a Frequency Sweep , the program tells me I need about
2G of memory and that I only have about 1G available.....

My new system has 512 of ram, so I know the problem must
be in how it is partitioned (extended vs conventional)...

So, can anyone tell me how this can be fixed without taking the
chance of buggering up the XP system that will mess up any
other programs ?

Thanks for your advice.

Andy W4OAH

There is no extended memory in Windows XP. It's a flat
address space. Try running your application in Windows 98
compatability mode. Right click on the .exe file and left
click on properties. Select the compatability tab and
enable compatability mode. Select windows 98 from
the pull down.
Then go to "Help and Support" and do a search on pif
Select the "Create or change a pif" result and read up on
how to assign extended or expanded memory to your
program.

Hi Bob,

What you want to resource here are the printed materials available
(then) from the manufacturers of analyzers in the time span of 1980 to
1986 or so. Those would include Analog Devices or Hewlett Packard,
both of which had superb application notes that went to considerable
detail. The academic treatments of that era were mostly semester
based fluff introducing concepts, and not many at that. Industry was
the best source for actually grasping the concepts and implementing
the details. Soon after this period saw the introduction of DSP which
is a silicon processor equivalent of the IIR or FIR math (resource
Texas Instruments from that slightly later era for this discussion).

You did quite well in describing the "zoom" process. This hallmark of
the Real Time Audio Analyzers designed by HP 20 years ago was a long
time in coming. They had a 16 member design team working with a
million lines of Pascal code. It took them 5 years to develop the
product in contrast to the HP design cycle of 18 months. They also
had to design their own Pascal compiler.

I would recommend for reading those works from the Program Manager
Nick Pendergrass (Google: "nick pendergrass" fft).

I just got a Dish Network "500" dish with two LNBs, mounting hardware,
and the in-home receiver.

Anyone got anything on converting these to UHF-and-above amateur
operations? Pointers on groups and/or lists? All information and
pointers gratefully accepted.

http://www.geocities.com/PatBillDavis/10GhzGear.html

Most of us convert them to 10GHz. They are too small to be very useful
at UHF. Plus, the DSS Feedhorn is easily modifed to 10 GHz by boring it
out to 0.75 inch and add an SMA connector as a probe to excite the
waveguide. See above webpage for a short tutorial.

Groups that do 10 GHz construction and contesting:

Andy writes:
Thanks John. You got me on the right track. Here is what I did:

1) clicked on the EZNEC shortcut icon and then on Properties and
Compatibility.
2) Set Compatibility to Windows 98
3) Used Windows Explorer to locate EZMAIN and right clicked , then
on Memory
4) Set Extended Memory to Auto and checked HMS box (I got this
from the EZNEC manual
when setting it up for Windows NT)
5) Then I closed stuff out and ran EZNEC with no problems so
far.....

I couldn't find any PIF file corresponding to EZNEC, but apparently
the other stuff was good
enough...

Thanks again for getting me started,

Andy W4OAH

A better way to use the 813 in triode mode is to connect the two grids
together. This creates a HI-MU zero bias triode. There is some data

for this in old handbooks for grounded grid operation. However running them in grid driven mode as zero bias triodes would be identical, except for lower driving power.

First, Good SHow on trying to interest the kids.

Secondly, have you investigated 160-190 KHz as an option. The transmit
antenna would be limited in length to a max of 50 feet but the receive

antenna can be tuned dipoles. The transmitter is limited to 1 watt output so it will be a heck of a lot easier to measure then the Low power Part 15 devices. If they live in a rural area they should have little manmade noise to contend with. Tuning the receiver and transmitter can be done with an oscope and low frequency generator. The other thing is the receiver can use a block converter with an AM radio.

Thanks for the reply. I had a "brain fart" at the time I was writing and the term "laminations" escaped me. I have various old transformers of various voltages, I hate to take any apart. I think that I will ohm them out and see if there are any open windings. Yes, hollow state technology, that's what I am in to. Got started at a young age. My grandfather made and repaired radios before and after the war. He is not doing too well now. I have most of his gear and NOS parts and such. Next weekend I'll be picking up his Riders. Got his Drake TR-3 (AC-3 and DC-3 too). I'll be getting that old Drake back on the air! Anyway I'm planning some amp projects in the future (After I clear a backlog of a dozen Transoceanics) I have a few

chokes but I just wanted to try my hand at making my own power chokes. Made RF inductors in the past for SW receiver 1930's style. I may be needin' up to 20 hy. I'll be on Google later on researching I suppose. Just thought I'd mention about the choke cores in case someone knew of a small qty source or had some to sell. I'm thinking about taking a bundle of soft iron wires (bailing wire) insulating them individually and corporately, then winding wire on. Fold the ends of the "core" together. Perhaps a nice project with my son; help him to learn. I've got a 15lb spool of 30awg to experiment with.

By the way, if Prof. Anderson is looking at this, I refrained in reading your latest long ego post. Except for the first paragraph. I will not react nor acknowledge your presence in the future. It would not be edifying. I do not believe you suit my purpose here on these groups, which is the friendly exchange of ideas and thoughts (when I have the free time to get on the computer) No name calling, no self promotion, no condescending attitudes. No bull. It's too distressing.

That is the way I am using them. Got it all together last night and had
a short QSO with a good audio report. It takes very little Ranger
audio to get 100% mod.

Unfortunately, the plate tuning cap started arcing so I had to shut it
down and have a look today.

My experiments at audio have shown that this mode causes more non-linearity than simple pentode mode. But... maybe not anymore than you'd get from a similar-sized high-mu zero bias triode, as those are fairly nonlinear too!

My experiments were with much smaller tubes (807's and 6L6's and the like) than the 813's we're talking about here. Most of the extant SPICE models do pretty bad when you tie the screen and control grid together (not surprising!)

Tim.

Tim -
You might be surprised how few parts there are in a classical zero-bias class-B modulator.

There's a schematic in the 50's/60's ARRL handbooks, and the ENTIRE circuit is two 811A's and an output transformer. That's it!

This simplicity is the cunning advantage and popularity of zero-bias triodes (or zero-bias-triode operation of the other tubes). Once you get to beam tubes/pentodes with all their bias supplies and screen supplies and power-supply-sequencing etc. you start getting into having to draw schematics.

Later editions added a pi filter on the output to reduce "splatter" and a control relay to remove plate voltage on receive.

Tim.

I guess I'm more interested in knowing what the supply and grid voltages
are, transformer ratios, a bill of materials, that sort of thing.

Yes, you are correct that the schematic of a one cubic foot, 100 pound
monster amplifier could be drawn on a business card, but still...

I too am interested in the transformers that he's using. Tubes are
easy to come by in comparison to appropriate modulation transformers.

And it can't be the super-simplest implementation because I see some
pictures with little power transformers with diodes and electrolytics
forming some kind of bias supply.

Then you have to work hard to not burn up your favorite modulation and
plate transformers :-). Plate chokes, I can rewind them when they
catch on fire now!

I agree that on not taking apart a good transformer!

There are enough bad ones that it shouldn't be necessary,
anyway.

The main problem I see with that is the magnetic properties
might not be as good, resulting in fewer henries than desired.

> I've got a 15lb spool of 30awg to experiment with.

EXCELLENT!

You might consider making some sort of winder. Chokes
typically involve thousands of turns, and you don't want to
just jumblewind them.

I will see what sort of basic choke data I can find in
my library.

Google my call, too.....

I am planning on building a solidstate amp of about 100watts to use with a low power transceiver. My interestrare 20 thru 10 meters and I thought I could save a little board space and maybe money if I designed the output transformer to cover just these bands. I have half the cores I need to build a transformer that covers 80 thru 10 I was wondering if this would be good enough for a transformer for 20 thru 10. Also the amp will be mounted right at the base of the antenna I am thinking of designing the amp with an output impedance considerably less than the usual 50 ohms. I am thinking this would make fial matching to the antenna easier. Any comments would be greatly appreciated.

Hi Jimmie,

As for the transformers needed for your project, thinking about it
quickly, the inductive reactance would decrease as you leave out cores
so at the higher end of the band I think you are going to have problems.
Iï¿½m sure there are others in the group that can guide you in this area.

Whatever you end up doing put an output filter on the thing as it will
amplify whatever you feed it just like the fundamental. Yea, I know,
all modern transceivers are clean. A little ï¿½over-killï¿½ never hurts.

I'm very curious why you are interested in mounting the amp at the
antenna? Do you intend to use it as a matching device for the antenna
as well as amplification? I believe that is where you are coming from
with the idea.

I want you to think about a couple things. The solid-state amp is going
to be a DC powered device. How long will the power lines have to be to
reach the amp at the antenna? You would need to run two wires, of
course, that are going to have considerable DC losses especially with
the current the amplifier has to draw. The ï¿½Iï¿½ squared ï¿½Rï¿½ power losses
would be substantial even on a short run.

The second thought is about the actual coaxial loss that could take
place at 28 to 30 MHz. As long as you are not planning to use RG-58 or
cheap RG-8, or making a few hundred foot run, the line loss would be
negligible compared to what you might gain from the amp being at the
antenna. Also, it sure is much easier to work on it in the shack
instead of having to climb a tower to yank it down.

As a final thought, if the antenna is 25 ohms, do what you need to do to make it OK. The worst case at a 2:1 SWR is around 10% power loss. I am a bit of a perfectionist with the impedance thing. So, I recommend choosing whatever matching system hits your fancy. If it is a balanced antenna by all means use a BALUN!

If we were talking about 2 meters or higher I might be a bit more concerned.

I do hope this helps with your ideas and project. I would be interested in knowing what you decide.

73,
Paul

> put out 200 watts (to round up a bit).

Not exactly! You're mixing input and output powers.

Current FCC rules limit us to 1500 watts peak output.
On AM, that typically works out to 375 watts carrier output.

To make the math simple, let's assume our Class C
plate modulated final stage has 75% efficiency.
Then we will need to run 500 W DC plate input to get
375 watts carrier output, and 1500 watts peak output.

The audio power needed to plate-modulate that 500 watt
DC input stage is 250 watts - exactly half the DC input.
More modulator power is OK - it's a good idea to
figure on 300 watts or so, to allow for various losses,
and so the modulator tubes aren't running flat out to
give you 100% modulation.

You can easily see how the design could get complicated
in a hurry. Suppose your Class C modulated stage is
only 50% efficient, instead of 75%. Then you would need
750 watts DC input to the stage to get 375 watts carrier
output. And you'd need at least 375 watts of audio!

--

When reading old Handbooks and other amateur
radio publications, it's important to remember that in
the past hams rated transmitters by DC input, not output.
If you build a "100 watt" transmitter from those days and
expect to get 100 watts of RF from it, you will either be sadly
disappointed, or will run it way over design ratings
in order to get those 100 watts.

In the bad old days before 1984, Part 97 simply limited
US hams to 1000 watts DC plate input to the final. Which
meant you simply needed 500 or so watts of audio to plate
modulate a legal-limit AM rig, regardless of efficiency.'

The old rules are one big reason plate modulation was
the AM method of choice for the Ancient Ones. The
carrier efficiency of most other AM techniques (grid

modulation, screen modulation, suppressor modulation, cathode modulation, conventional AM linear, etc.) is only 30-35%. So for a kilowatt DC input, you could only get about 300 watts of carrier output, and you'd need a final that could dissipate 700 W!

Under today's rules, the DC plate input doesn't matter - only the peak RF output matters.

btw, there's all sorts of tube data info online. No need to buy tube manuals anymore unless you are really into paper!

Nah. The number of question marks is immaterial and avoids the
contentious and intolerant (rant?) of the OP. Such comments very
divisive to the the Amateur Radio hobby; IMHO.

Might one not think such an intolerant (possibly also an elitist?)
attitude by a serving (already licensed) radio amateur does not augur
well for the future of the hobby. Not sure as a newcomer I'd want to
join a group with members who have that 'unkind' attitude!

Previously noticing some other intolerant (even vituperative) comments
would not be surprised they may tend to give outsiders a view of an
outdated, closed knit clan/society. Old codgers still using spark
transmitters and coherer receivers, pounding away in their dimly lit
shacks late at night and boasting about how many countries they have
contacted for 500 milliseconds per contact; and please QSL.

QSLs via the Internet these days I presume?

Total four (4) question marks; used one at a time!

Rather than portray Amateur Radio as open, welcoming to younger
newcomers and new modes of communication/trends.

No wonder the hobby is, in the opinion of some, dying?

The hobby is alive and well, though offshooting into private little cliques here and there.
Paul W. Schleck is a bit delusional what with his new, exclusionary new newsgroup, but like all fads, this one, too, will pass.

Paul's new moderated group, I predict, will see a modicum of new users at the outset, but after, say, 60 days his moderated group will wither on the vine and become history. His new moderated group was doomed for failure well before it reached fruition.

I wonder if BlowGut Paul will send his "welcome" messages to the new users of his self-serving moderated group? He, Paul, has a knack for being an insufferable blowhard. Come to think of it, he is not too far removed from the gasseous emissions of Lennie, the California Cryaby who still has issues with old zoning matters.

Oops! Tsk! Tsk!. Did I poke politically incorrect fun at a poor, disgruntled oldster whose colostomy bag runneth over?

I was tired when I made the post and for got to say that this would be a mbile unit. antenna mounted on my tool box in the bed of my pickup. It was really just a thought about mounting the amp in the tool box since room in my little Nissan is scarce. From there I made the leap to thinking since the feed point impdance of the antenna is already going to fairly low and feed line length practically 0 why step it up to 50 ohms just to drop it back down again. More realistically I am thinking a short antena on 20M may be more like 10 ohms wich would be a 5:1 SWR and I dont think my amp would like that much. At best I am thinking the 10M antena I am planning on using will have the 25 ohm impedance you metioned, 15 and 20 m antennas would have even a lower impedance.so an output impedance of say 15 ohms might be a good thing.

All OK Jimmie, now I get it. Mobile never entered my little mind.

If you were only going to use one band I can see how the idea might work. But, looking at all the different impedances the output will see on the different bands will be a problem.

I just tore apart an old plasma amplifier that utilized a solid-state driver stage. Itï¿½s loosely based on the Motorola design. Anyway, the output transformer uses three beads on each side. You are welcome to it if it will help you out with your project. Its just collecting dust here and I have no further use for it.

100Khz band width seems like a lot of overkill to me to be feeding a
sound card. Several years ago I built something like is beig asked
about using and instumentation grade op amp with a bipolar emiter
follower circuit . Negative feedback to the opamp was taken at the
output of the amp. Specs on this thing was unbelievable. DC to
500khz(limit of the test equipment) with about 1.5 mv of noise. How I
dream of the days of having a bench stock like that to select parts
from again. Made a great headphone amp.

BTW, initally used a 741 in the circuit and it had about 5mv of noise.
If this OK it could still do the job for you.

646. FU Hammarlund Testing later this week on FreeWheeler's net.

If all goes well with the alignment, I should be on next week, with this rig, testing on the FreeWheelers Net 10:30 pm central 3.916 LSB. That band's crystal is working good.

Can you imagine that? People could communicate around the world simply by
constructing a simple transmitter salvaged from a Model T ignition coil and
a receiver contructed of metal filings in a glass tube between antenna and
ground and a battery powered relay.

Amazing. Absolutely amazing.

Yes, with the most basic materials; little more than a battery and
some wire, in an emergency or primitive conditions you can communicate
via wireless. But you must have one more thing; gotta have code

Right. And that's still modest for a pair of 813s, at least used as
pentodes in class AB-2.

I think at that point I'd decide I needed a better modulated stage,
unless I were operating at UHF.

The tube manual I quoted is good for two things that you don't get as
easily from the web -- the front pages are a very good text on tube
amplifier design, and you can read it while you're eating your cereal in
the morning. I'm just old enough that I need things on paper -- were I
ten years younger I'd probably not need it at all.

The problem with 807/6L6's in zero bias is that the suppressor cage is grounded to the cathode and messes things up. With the 813 you can connect the suppressor to the plate and the two grids together (or connect the suppressor to the grids). One way or the other will work better than grounding the suppressor.

There have been triode circuits using the 807/6L6/1625 or even sweep tubes (such as the 6AV5) in which G1 was tied to G2 with a resistor so G2 was driven harder than G1. One circuit used a dual cathode follower driver with a center tapped choke to provide a low resistance ground for the grids (actually used one winding of an interstage transformer).

A member of a radio club I was in years ago built a high power two meter AM rig using a 5894 final modulated by a pair of 6AV5GA's in such a circuit. It always got glowing reports on audio quality.

BTW I have 5 or 6 used 813's in the junk box gathering dust. I'd like
to keep one for static display and the rest are available for nominal

cost and shipping. If anybody can use them let me know. I'll also take
2 or 3 good 811A's in trade.

Have an 8558B (Serial # prefix=2332A) that seems to work fine except that it indicates ~ 30 dbm low. Any suggestions as t what might be the cause?

I suspect the U1 diode pair in the 1st LO. 1) How to test same? 2) appropriate replacement diodes if indeed they are bad?

Please advise

> pentodes in class AB-2.

Agreed - in fact, maybe even in AB1!

A pair of 813s in full-yellow pushpull Class B audio service
can deliver 650 watts of audio, according to my 1948
ARRL Handbook. With just 0.35 watts of driving power.

I think the main reason the Ancient Ones used triodes
in their modulators so much was to avoid the problems

of a screen supply and a bias supply. Since they were
building a separate speech amplifier anyway, building
one that delivered 10 watts or so wasn't much different than
building one that delivered a watt or so.

Two articles of interest:

In QST for November, 1958, is "Medium to High Power Audio from 813s".
A modulator using 813s in pushpull AB is described. It is really quite
simple, too.

The bias supply is just a halfwave rectifier feeding a 0B3/VR90.
Screen supply is obtained from the plate supply with good regulation
and without a humongous power resistor by using a 211 triode as a
series regulator, and a string of NE-2s for reference.

This series regulator setup has a lot of advantages. The screen supply
is regulated, there's no enormous dropping
resistor, and most component failures result in a loss of screen
voltage rather than excessive screen voltage or screen voltage without
plate voltage. But you need a big
triode for the pass tube, with a well-insulated transformer to
light it.

According to the article, a pair of 813s in AB1 will provide 260 watts
at 1500 volts B+, or 335 watts at 2000 volts B+ - with *no* driving
power!

In AB2, it says you can get 455 watts at 2000 volts and 650 watts at
2500 volts, with less than a watt of audio drive.

There is also a "peak extension circuit", which is a form of
supermodulation by limiting the negative modulation percentage. Such a
system was a big deal in 1958, but if
you use one today, the carrier power has to be *decreased* to stay
legal! Hardly seems worth the trouble.

Another interesting article is from QST for March, 1948. "500 Watts of
Audio from AB1" shows a modulator
that ends up with a pair of 4-250As - driven by a pair of
6SJ7s in a phase inverter! Speech amplifier, mod iron, screen
regulator VR string, bias and low voltage supplies are all on the one
17x13x3 chassis...all you need is 2500 volts for the 4-250As.

The only transformer in the audio chain is the modulation transformer
- all other stages are resistance-coupled. The speech amp is just four
tubes - 6SJ7 mike amp, 6J5 2nd audio, pair of 6SJ7s phase inverter.

> > You can easily see how the design could get complicated

>
> I think at that point I'd decide I needed a better modulated stage,
> unless I were operating at UHF.

I chose 50% to make the math simple and to illustrate the point. And
it's easy to get less than 75% efficiency in real life when a rig has
certain compromises, like trying to cover 160 through 10 with tubes
that have lots of output C.

661. Need help with antenna issue

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-02-26 06:10:45 UTC
From: David <dhuisman@bigpond.net.au>
Message-ID: <FRuEh.3759$8U4.1425@news-server.bigpond.net.au>
Source record: 8300

I have just completed the design of a 151 MHz ASK transceiver.

On the bench the unit works fine with sensitivity to around -115 dBm
however, when I attach an antenna, the RSSI level increases dramatically
and it appears something may have become unstable.

I have tried a commercial ground independent antenna and a 1/4 wave whip
and the results are the same.

If I disconnect the antenna and leave the RF input floating, it behaves
properly. I can also attach a small wire (say 300mm) directly to the RF
input and it also works fine. It just plays up when I have a proper
antenna connected.

I am not sure if this may be some issue with the VSWR of the antenna
causing some instability (I tried a 3dB pad between RF input and antenna
and this did not fix the problem), or whether the input is so sensitive
that it is picking up the LO from the radio and causing regeneration ?

A Spectrum Analyser was used to determine if anything else is being
transmitted in that region and it appears to be clear to well outside
the bandwidth of my receiver.

Any ideas much appreciated for what might be happening or methods of
debugging my design.
(The circuit consists of an RF switch after the Antenna port (selects
TX/RX) then into a 50 Ohm RF Amp, followed by a tuned circuit into an
SA6505 RF IF. The LO is crystal based harmonic Butler emitter follower.

PS. I also tried bypassing the RF Amp but still no improvement.

Thanks in advance

Regards

David

If you suspect stability issues, you might try connecting a variable
resistor and variable capacitor to the input and try to check various
settings to see, if you can repeat the situation without the antenna.

>A Spectrum Analyser was used to determine if anything else is being
>transmitted in that region and it appears to be clear to well outside

Depending on your location, the band noise level at 150 MHz may be
well above the thermal noise from a simple resistor. How well is the
spectrum analyzer calibrated ? Did you get the reading for a 50 ohm
terminator resistor at the input and then compare the band noise with
the 1/4 wavelength antenna ?

"50 ohm RF amp" sounds like some MMIC, such as the MAR-x series. I
hope that you are not using MAR-8, which is not 50/50 ohms in/out :-).

Optimise the series (DC blocking) capacitor in the amp input.

I`ve been a Ham since 1975 and seen this kind of talk before. You 2 are the ones destroying Ham Radio. Yes ham radio is alive but not well. The numbers are dropping and the age of us Hams are getting older. Soon if we don`t attract younger people in it will be a dying hobby. Code is important yes but not totally necessary. There are other ways of encouraging young people to become hams. Code can be part of it as well as the computer end. Why not be like the Boy Scouts have HAm Radio clubs in schools from grades 1 and up and in churches or the YMCA/YWCA with volunteers.

Rather than bash each others heads and stoop so low as calling each other names why not put your heads together and think of positive ways to bring new people into the fold !

It could be that there are local signals in the band which are
overloading the receiver and the receiver lacks selectivity to
discriminate between on and off channel signals.Or an IF image response
is reacting to a specific interferer. Have you tried tesing inside of a
shielded screen room (faraday cage)? Secondly, the gain of the circuit
could exceed the shielding and grounding of the circuit layout, thus
feeding back from circuit to antenna. In this case, assuming a 50 ohm
circuitry, extend the antenna with a length of low loss coaxial cable
away from the circuitry, put the circuit in a shielded box with
appropriate feedthroughs, and check for interaction.

I think the terminating impedance has an effect on the response. A serach on either condensor mic or electret should yield some info. I know that the housing or cavity that the element resides in can have a pretty dramatic effect as well.

668. Need Toshiba radar components data

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-02-27 02:21:16 UTC
From: hexter@blazenet.net
Message-ID: <45e3959c$0$6827$470ef3ce@news.pa.net>
Source record: 8307

Hi folks,

Can anyone help me with a data book or catalog listing data
for the Toshiba limiters, circulators, MMIC front ends, etc. for
JRC/Raytheon/Furuno X-Band boat radars made in the 1980's.

I have searched the net and found nothing, and yet I own dozens
of these devices pulled from junked radar units. I have a 'rough'
idea but it would help to know the original specs, mainly for
the MMIC devices.

I realize they won't tune the hamband, I really just want to find
out if they meet original specs.

Thanks!!!

669. Racal RA6790/GM GPIB Codes

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-02-27 03:48:06 UTC
From: "J. Mc Laughlin" <jcm@power-net.net>
Message-ID: <12u7ae1r9mhe38d@corp.supernews.com>
Source record: 8308

I am looking for the complete set of codes that are sent to a Racal RA6790/GM receiver via its stock GPIB (IEEE-488, HPIB) port. $02F12.12345 changes the frequency of number 2 receiver (set with dip switch next to the GPIB socket on the receiver) to 12.12345 MHz.

The manual found on the Internet discusses the use of a serial port.

Google pointed to a site where a 232 to 488 converter was used to control an earlier model of receiver that contains a GPIB module. Some of those codes do work with the RA6790/GM.

Pointers to the information will be appreciated.

You aren't going to directly damage any cars around you even with high
power, but you might affect some with a 100 on HF or even 2-meters.

>overload to a nearby radio likely? At what power level is damage

Ham or broadcast? Broadcast is generally fairly sensitive to
overload. On-the-road it's likely to be for a very short duration so
I'd not worry about it.

>likely, and to what componets?

With today's cars it's unlikely you are going to damage any components
unless you have a grounding problem and then the computer is the most
susceptible.

>
>I am currently using only 50 watts on a 5/8 wave (2m), 25w on a 1/4
>wave (10m), legal 4w on a 1/4 wave (11m)

I've run 160 watts on 144 which will *typically* desense another
2-meter rig for up to a 100 feet or so, but it depends on the rig.
I've also stopped the car next to another mobile with no *apparent*
problem although here certainly had to be some desense. I've also
"desensed" a mobile 50 feet away with a 5 watt HT (It did have a
clean signal) I also shut down the cable TV system for an entire town
with a 5 Watt HT at a demonstration, but that's another story other
than to say two days after the demonstration you couldn't find a cable
leak in the whole town. <:-))

Some mobiles are running up to 600 watts on HF without problems while
others can't get a 100. Most of the car manufacturers are saying you
shouldn't go beyond a 100. I'd have no qualms about going to 500 or
600. If it works, fine. If it didn't I guess I'd have to pay for what
ever broke.

When I purchased my 4-Runner the Toyota mechanics ran the wiring for
my VHF/UHF rigs and that was about 6 years ago. My wife runs a 50

watt (Kenwood TM-V7A) in a Toyota Prius (Hybrid). I'm thinking of leasing one while they still have good prices and a surplus of cars available which will disappear sooner with the price of gas going back up. Only problem with leasing the Prius is how to run an HF rig in there. Their 12 volt system is very light duty and that 500 volt batter might be a bit steep for my mobile rig. <:-))

Some thing wrong there. I'm running two stations here and both are
capable of the legal limit. The one in the shop is a bit more modest
with a 2K4 instead of an Alpha, but both are *old*. OTH there is the
whole Hallicrafters station in the shop as well. The antennas are
fairly close and there has never been a problem. Those antennas
http://www.rogerhalstead.com/ham_files/Tower30.htm (the wire antennas
are difficult to see) are much larger than what your friend would have
had on the mobile. Unless the mobile antenna was almost touching the
other rig's antenna and I do mean almost touching it shouldn't have
created a problem. The antenna over the driveway would have had to be
low and very close to the mobile antenna.

>three times to think it through and as he should have been doing,
>switch his base antenna (dipole over the driveway) to ground, when not
>in use.

I don't ground or disconnect any cables even during thunderstorms.
Basically I can't easily get to the cables and any thunderstorm would
be past by the time I could get them disconnected.

The tower, with a large antenna system
http://www.rogerhalstead.com/ham_files/Tower29.htmtakes an average of 3 visually verified direct hits a year although it took 5 by the beginning of August last summer. OTOH I have a good single point ground with 32 or 33 (lost count) 8' ground rods CadWelded (TM) to over 600 feet of bare #2 wire that ties the whole antenna system and house electrical ground together.

Those were the days when the techs would check the output by putting
their hands up in front of the antenn to see if they'd get "warm".

==========
A bi-filar winding A-a and B-b . Connect a to B (that's the centre)
Number of turns is half the total required. A and b are obviously the
end connections.
So a toroid requiring 10 turns with a centre needs 5 bi-filar turns.

Besides a bifilar winding, which has already been suggested, try this:

Start at the middle and work towards the ends.

Say you need 10 turns center tapped. Take a piece of
wire long enough for 10 turns, find the exact halfway point,
scrape off the insulation there and make a twist. Then put the twist
on the outside of the core, and wind one end 5 turns one way around
the core, and the other end 5 turns the other way.

Or, use two pieces of wire long enough for 5 turns, Wind the first
one, bring its end out, twist/splice to the second one, wind 5 more
turns.

Who's answer in broken english was "We don't support those products
any longer". And I asked in disbelief "Can't you help me with data
sheets or tell me where on your website I can download the .PDF files".
Mr. Suckagookie said "We no longer have that information". So would
you like to kmow how many of those "If you want to talk to a real
human you are S.O.L., if you want to listen to more stupid choices
press 2" that I fumbled through just to get Mr. Suckagookie on the
line.

Have you had any luck getting obsolete data sheets from a Jap
company recently? I thought not. Duhhhhhh.

Thanks for casting the first stone of stupidity by accusing me
of not having tried all logical avenues first. Thanks for appending
Duhhhhh to your reply as an insult to me.

About all I can really say is that you are probably one of those assholes who is to stupid to turn off their foglights when it isn't foggy. Thats why they are called fog lights and not "Turn'em on any f--king time lights". See if they were supposed to always be on they wouldn't have that second switch that intelligent folks use to turn them off with. Yes, giving you access to usenet newsgroups and giving you fog lights was like giving a machine gun to a fucking monkey. Same results. Do you have any idea what those parts I mentioned above are used for and how? Do you know anything about 9.3ghz to 9.5ghz portion of X-Band where I spend most of my work day. Here's 50kw of ionizing radiation for your thoughts. Remember, always look directly into the magnetron at very close range while testing the pulse forming network, it will spark your imagination. Found an old CB amp in my junk box today. Spec plate on the amp says it will cover 80 thru 10. I plan on doing some mods improving the bias.and add some filtering I think this may give me what I want. I forgot I bought a 5 galon bucket of these amps at a hamfest years ago and still have a few around.

Mac, there's about 13 pages in the manual about this (the later versions
anyway pp 3.34 to 3.47). I'm sure Gary will be only too happy to sell
you one of the reproductions he does...

Roger. I started a thread earlier on using 813's as triodes and it was like falling off a log. The modulator consists of a very small chassis with a fil trans, tube sockets and a meter. This sits next to the mod iron on a wood deck. I like the idea of the mod iron isolated from ground.

> Such a project is never really "finished", because there are
> always new ideas and parts to be tried out.

Roger again. I want to eliminate the Ranger for one thing starting with the audio. I bought a 4W audio pre-amp and when I get tired of playing with the new rig I want to see if this will drive the 813's. I need some ideas on interfacing the two... some sort of interstage audio transformer I suppose.

Then, a simple xtal controlled exciter would be fun.

No end is there?

Besides a bifilar winding, which has already been suggested, try this:

Start at the middle and work towards the ends.

Say you need 10 turns center tapped. Take a piece of
wire long enough for 10 turns, find the exact halfway point,
scrape off the insulation there and make a twist. Then put the twist
on the outside of the core, and wind one end 5 turns one way around
the core, and the other end 5 turns the other way.

Or, use two pieces of wire long enough for 5 turns, Wind the first
one, bring its end out, twist/splice to the second one, wind 5 more
turns.

73 de Jim, N2EY

Gotcha. I am new enough at winding toroids that I am probably going t use
the bifilar winding technique, which seems like it might be more forgiving
if I need to make adjustments afterward (correct me if I'm wrong.) But I
understand what you are saying here, and appreciate your input. Thanks
much. Once I get more adept this is what I will do.

Gotcha! (I think.) So I should wind half my turns with A to a, then
connect a to B and wind the other half. Have I got that right? Or do I
Wind A to a and then wind B to b over that (not actually connecting one to
the other), using B as my CT? (When I first read this that's what I thought
you were talking about, but now am wondering...)

Thanks for help,

Dave

Dave-

How critical is your center tap? If it important that the tap be perfectly centered, it would be better to use one bi-filar winding instead of the two separate windings you describe.

If possible, spread the turns out over the toroid so the end is next to the beginning, so the center tap can be easily connected.

If there are a lot of turns using small wire, you can first wind the wire pair onto a shuttle (a long, skinny flat spool). Then unwind it from the shuttle while passing it through the toroid. With lots of turns, it might help if the two wires were different colors. Otherwise you would need an Ohmmeter to determine which is which.

Hey Fred,

Actually, I realized after I posted that last one that it is not actually a "center" tap. It is tap about 20 to 25 % up from the start, in a 2 uH coil. The original plan called for an 8-turn (on a 1.5 in form) air core coil with the tap on the second turn, but I am wanting to modify that to use two switchable coils with as little interference between them as possible, thus the toroids rather than air-core coils. My calculations tell me that a 2 uH coil (on an Amidon T-50-2 toroidal core) would have 22+ turns, so I am guessing the tap would be around 5 or 6 turns. Question: could I wind the first coil (for 2 uH) and then overlay it with the second (for the five or six turns), connecting them at the beginning and hooking up their respective ends to the appropriate components? If desired, I can upload the schematic I am wanting to modify. It is the oscillator described in the Hands-on-Radio column of QST in the Aug/Sep/Oct/Nov issues (experiments #43/44/45/46 in the series.) The original idea was a Hartley osc. that

ended up becoming a crystal-controlled transmiter for the 40 meter band, but I am wanting to use the osc to build a makeshift signal generator for testing another project. (I don't have a signal generator currently, thus the attempt at building a makeshift one.)

Apologies if this is too confused. I am obviously a newbie. If all of this is so far off-base as to be hopeless, just tell me so and I'll try not to bother again.

Thanks,

Dave

IMHO, the bifilar technique is more difficult and harder to
adjust.

Also, a bifilar winding used as a center-tapped coil will have
higher inter-winding capacitance and a lower self-resonant
frequency.

One thing to remember about toroids is that you can always take
all the wire off and start over.

Perhaps the best idea is to try all the methods and see
which works best for you.

It's most likely not the mic causing that issue. Most condenser mics
have a great freq response. You should look at the circuit and zero in
on any RC filtering that may be taking place... giving you that
"bassy" sound.

Hello mates!

I'm really confused. I just built an I/Q based transceiver (mostly following the Youngblood articles) and just noticed that when I'm using either PowerSDR or sradio, I can still demodulate everything if I plug I or Q connector off from the rx.

I thought that PowerSDR and Sradio are both IQ based softwares. Is it done just by mixing the audio to baseband. Where those programs need the phase relation between I and Q. Yet, I noticed that putting the other component back, the reception improved many db.

Looking for some answers. Thank you!

Quite true on wideband audio response and the necessary
amplification that must follow it.

Working around stray RF fields can cause other problems
around electret microphones. They are inherently high-
impedance so one has to pay attention to the VLF and up
stray RF because of that high impedance...especially if
using newer op-amps or other active devices having high
frequency amplification. It is a compromise in design:
attenuate the VLF and above response but hold the
microphone amplifier response flat out to at least 10 KHz.

Here's a suggestion that's an old one when I first tried it
(successfully) 30 years ago on multi-filar windings: Get
an old hand-operated drill (electric if it has slow speed),
lay out equal lengths of magnet wire, tape one end of
the bundle securely, chuck the other end in the drill
and do the twisting. Pause several times while doing so
to make sure there aren't any sharp twists along the
way, "iron" those out with fingers. You can get an idea
of the number of twists per inch (or meter or whatever)
as you pause...for wideband RF transformers the number
of twists per unit length need only be approximate. What
you wind up with (no pun intended) is the equivalent of
multi-wire balanced transmission lines of relatively low
impedance and the total length would be roughly a
quarter-wavelength at the highest frequency of such a
transformer.

However, if you are doing a tap for a lower-impedance
point such as an oscillator feedback or impedance in/out,
the physical tap position doesn't have to be precise or
absolute (lots of other factors will be involved there).
Just get as close as you can to published data/article
on tap position and you'll be okay. Winding toroids may
be new to lots of folks but all it takes is more patience
than with old-style cylindrical forms.

I might add that, once a circuit is working with a toroid,
it can be secured by using some petroleum-based
varnish lightly brushed over it. Most "boat" or "spar"
varnish types are good for that but one is stuck with
having to buy quart cans of it (rather expensive). The
reason I mention marine varnish is that it stands up to
moisture in the air. If you use "Q Dope" (liquid form
polystyrene) it looks very nice when done but a year
from now the moisture normally in room air can "lift"
it from non-porous surfaces. On testing with MF to
UHF Q Meters, there is no more degredation of Q

using varnish than with liquid polystyrene or lacquers. I use the McCloskey brand "Gym-Seal" varnish because that is also good for wood surfaces around the house; it was originally formulated as a surface varnish for gymnasium floors and the like. Takes at least an over-night drying time with a complete cure in two days.

I posted a small windows program in alt.binaries.schematics.electronic that some here may find useful.
The subject line to look for is "Paralel resonant circuit tuning range calculator program. -
TuningRangeCalc.zip (0/1)".
As the name implies it calculates and displays the resulting capacitance range and resonant frequency range
for a parallel resonant circuit using a main variable capacitor along with padder and trimmer capacitors. The
values for the parts are set with a set of slider controls and the results are displayed as the sliders are
moved.

I hesitate to put an oar in because I'm one of the brand new Hams. We managed to get two dozen people to a one weekend tech class that were mostly drawn from the membership of Community Emergency Response Teams. I think that the service can be alive and well if it continues to adapt itself to public need rather than to individual preferences no matter how strong.

Having said that I will now admit that I was somewhat disappointed by the ease with which I passed the exam. I had a novice license back around 1973. At that time you had to pass the general theory to get a technician class license. Obviously that is no longer true.

Now at the risk of being dangerously on topic let me ask the question I came here to ask in a new thread.

One thing I want to add. I have built tayloe detector polyphase
network receiver before and I know,
that we need I and Q to cancel out the image. But how the heck AM and
FM is done?

I just have a glue, that the I or Q signal is mixed to a higher
frequency and detected in traditional way,
but in software. Though, is there reason to mix it to a higher
frequencyif we are doing it in software?
Ok, that was the glue about FM, but AM, I can't even have a glue...

Thanks,

Hi Janne,

I and Q each contain all received signals, and unless your ears are better than mine you can't really tell whether you're listening to I alone, Q alone or the full demodulated signal. I and Q are needed together to determine whether the signals demodulate into the upper or lower sideband, so if you have signals spread equally across the band, listening to only one of the channels will fold the upper and lower sideband signals together and you will receive twice as many signals in a given bandwidth. This is the same as a simple DC receiver. Note that your spectrum display will be symmetrical about the baseband frequency if you disconnect one channel--all signals appear twice--in the upper and lower sidebands.

In theory, I and Q each contain half the received power, and if only one channel is present you spread the 3 dB reduced power to two places (upper and lower sideband) so you will see a 6 dB total loss with respect to the fully demodulated signal when you disconnect one channel.

AM and FM demodulation can be done in software regardless of whether the signal is mixed to a higher audio frequency (say, 11 KHz as some SDRs do), or mixed right to baseband. For AM at least, the demodulation algorithm is probably a little simpler when mixed to baseband. For FM likely the opposite is true. Once you understand the nature of IQ demodulation a little better the AM and FM demodulation algorithms may become self-apparent to you.

73,
Glenn AC7ZN

Personally, I think the service needs to stop focusing on raw numbers of licensed hams, and instead on the *quality* of those hams licensed. I would rather have 5 hams licensed who are interested in antenna theory, emergency communications, etc., rather than 10 hams who are interested in using ham radio as a cheap cell phone.

The current structure of the theory examinations is a joke. They really do nothing to ensure the applicant has a through knowledge of the topical material. For example, you could have failed each and every question on rules and regulations, and yet still obtained your license, simply because you know math well. This is not, IMO, a good thing. We are, however, unlikely to see this change for the positive, and highly likely to see the theory examinations weakened further as we move to a "simply mail in your 605, no exam needed" ham radio of the future.

Give me quantity. Antenna "theory" has not changed in 50 years, it is a
given--a "known" in its present state. We need mind to come up with
new ideas, apply newly discovered physics and give us something new to
work with.

What do they need to know to grab their rig, coax and antenna off ebay
and begin in the amateur bands, oh yeah, and know band limits and modes.

707. Long range rural wireless high speed data options...

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-03-03 18:37:18 UTC
From: Day Brown <daybrown@hughes.net>
Message-ID: <1172947038.139960.11470@t69g2000cwt.googlegroups.com>
Source record: 8346

Without clear Line Of Sight do not exist. I intend to solve that problem. If I do, I'll get rich. The equipment now being offered is not deigned by people who live in rural ares, but engineers who, at best, are in suburban office parks.

Right now, I'm using the satellite data from hughes.net. Its not the high speed bandwidth advertised. The power supply was designed to be plugged into the wall. [that's a period] But if you live out here, you know the power goes out. but if you plug their power supply into your UPS, you find the damn thing blocks the next two backed up power outlets. Hello?

I've tried the 900mhz wireless transceiver. which needs a clear LOS (Line of Sight). I like living in the woods; and I'm not going to clearcut just so I can get a clear line of sight to the ISP transmitter tower. Hello?

I also have a place in a deep hollow by a spring fed trout stream. No way will any of the commecially available wireless transmitters work down there. You cant even use a cell phone. Hello?

No, I'm thinking about 180 mhz, kinda close to TV channel 8, but... out here, the nearest TV channel 8 transmitter is 300 miles away. Besides, TV antennas are being scrapped all the time; everyone is switching to Dish TV. Out in rural areas, RFI/EMI from ham gear no longer bothers anyone watching TV.

Besides, seems like there mite be pulse emitters/detectors that work at this speed. No Carrier wave, no IF. Technically, its *NOT* "radio". Ordinary tuners would ignore it; it aint AM nor FM. A 12 db antenna would be about 13' foot long. Awta go 30 miles to an ISP in some town that stays up serving users on the weekends. I've tried all three of the local small town ISPs, which have a nasty habit of crashing on friday nite, and not coming back online til monday morning.

I called "support" one time to bitch, and mentioned that I used Linux. The response: "What's Linux?"

But what's the best option to go from full duplex into the PC? will the standard LAN multiplex at 180mhz? RS232?

Y'know, in the "Hitchhikers Guide to the Galaxy" trilogy by the late Douglas Adams, there were three arks of humanity. The first was filled with all the thinkers. The third was filled with all the folks who got things done. The second ark, however, was filled with all the folks who didn't really do much for a living. They were the vice presidents of companies, the executive managers, the marketing people, the lawyers, the car salesmen, and the career politicians.

The second ark crash landed on earth. The survivors decided that if they were going to survive, they needed to build a committee to find figure out this "fire" thing. And the first question they asked was how were they going to market this sort of thing. Were they going to aim to build a pocket fire? Would people buy portable fires? Did they want them in different colors? How would they sell fire?

This is where you are. You know there is something out there that needs doing. However, you have no clue how to go about it. So you ask peripheral questions to see if anyone else is going to step forward and do your homework for you.

Honestly, there is so much to know and so much to learn that I couldn't possibly summarize it here. But to start you off, a router interface with a serial WAN port will work. So will SLIP on an RS-232 link. But I suspect you knew that already. Good luck building your radio. Be sure to post the details on the web if you ever get it to work...

Of course it's radio. You'll find that if you aren't radiating a signal,
there's no signal and it's not radio. Otherwise, it's radio. And that
means licensing and all the rest.

And there's a good reason wifi is higher in frequency. Because the
bandwidth is there, to allow for multiple signals. Likewise, the shorter
range means losts of points can reuse the same frequency, because the range
is quite limited. And of course, the higher the bandwidth of data, the
more radio space it uses.

Move to a lower frequency, and you'll have less chance to control the signal.
You may find there's too much interference to other users. There may not
be enough radio bandwidth for everyone who wants it.

That you don't realize this would be radio is a good indication, like someone
else suggests, that there is no solution for you because you don't have
the grounding to go anywhere with it.

Several things come to mind here:

Quantity vs quality we hear a lot about. The former is good for publishers and equipment manufacturers and the latter is good for interesting QSO's.

Someone mentioned the importance of ham radio as a service to the community. What makes ham radio so special that it has to be a service to anyone other than those who enjoy it? All such justifications are pure nonsense these days.

It is also frequently said that ham radio is an "old man's hobby". So what! There are plenty of hobbies for children. I for one enjoy getting away from teeny boppers.

I get a great deal of pleasure out of talking to people my age and exchanging experiences and how we got here. I have nothing in common with children. I would be delighted to elmer them but competing with computers, cell phones, drugs and teenage girls is beyond the call of duty.

I welcome them into the community but to go trolling for them is a waste of energy.

People complain about the crowded bands, QRM, rude behavior and yet whine about declining numbers.

Won't it be nice what all that open space on 75 is filled with CB level hams?

JACK K9ACT since 1955

p.s. check out the POW for what "old men" can do :)

711. Europe to Test 1000s Chemicals on Millions of Animals

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-03-03 23:05:15 UTC
From: TONY <from_tl@hotmail.com>
Message-ID: <1172963115.857522.79740@s48g2000cws.googlegroups.com>
Source record: 8200

Tony
Nottingham
England

3 March 2007

TO: All People Who Care

A new European Chemical Testing Policy called
REACH has now been finalised by the European
Union. Under these proposals Chemicals of every
kind - from those used in industrial processes to the
ingredients of consumer products - will be tested on
Millions of animals from mice to fish to dogs, causing
untold suffering.

Still worse, because of this reliance on outdated animal
techniques, reliable and relevant information will not be
provided and our safety will not be assured.

If you believe that REACH should make more use of
Alternative Testing to test 1000s of Chemicals that
have been in general use since before 1985 then
please take action now.

If you are a European citizen please contact your local
papers and own MEP asking them to promote the
development of humane non-animal testing methods
under the REACH legislation, which is the best hope
we have for sparing animals the misery of a testing
laboratory.

A sample letter can be found at the BUAV (British
Union for the Abolition of Vivisection) website at
www.BUAV.org (Select Campaigns, Chemical Testing,
Get Active then Writing to the local press).

For all Non-European members, you can still help.
Please tell all your colleagues and friends in the UK
and Europe about REACH. Write to your own local
papers to try and inform others about what is going
on in Europe.

The website for the European Parliament is
http://www.europarl.europa.eu.
Information on REACH, the New European Chemical
Testing Policy can be found here.

Everyone can help and you can make a difference.

Thank You

The whole reason there's a problem is that there aint that many users.
If there was, DSL would be here. If you drive from Little Rock north
thru the Ozarks up US 65 twards Springfield MO, most of the time you
can use your cell phone. But get 20 miles east or west of that string
of transponders, and its dead even if you are on a mountain, never
mind behind a ridgeline, much less down in a creek bottom.

For right now, there arent any other users. And even if I get this
developed and working, there wont be that many. The population density
is low. The biggest town in Van Buren county is Clinton, pop 3000, and

in Searcy county Marshall, 1200. And if you drive from Clinton to Marshall, the only town is Leslie, pop 627. Moreover, if you drive up US 65 from Leslie twards Marshall and hit the search button on your FM, it'll find the Christian fund radio station in Marshall. Hit 'search' again, and it'll find.... the Christian fundy radio station in Marhsall. There is dead air all over the TV and radio bands out here that nobody is doing anything with, nor will they ever.

Bring a portable TV up here, and the rabbit ear antenna will find two TV channels: 4 & 6; and if you come down off the ridgetop, only 6. I got a 12ft boom Yagi on a 25' mast on the top of a ridge, and all I can get are 2,4,6,7,11 in watchable condition. 16,20,38,42 are too snowy to bother with. Anyone who wants to watch much TV or listen to the radio gets a satellite dish.

I'm only 6 air miles from Clinton, but the ISPs to hook up to are all in town, down in the valley with a mountain to get over. CB radio at 27mhz can bend down in there, but anything over 100 mhz looks dubious. Leslie has an ISP up on the side of a ridge, that would be close to line of sight, but I'd havta clearcut about 14 miles of timber to get thru unless I get down to 400 mhz which has a wavelength longer than wet pine needles. Even if I could get over that, the pine grows about 18"/year.

One of the reason folks live out here is we like the woods; there's a lot of it. National & state forest, game & fish land, transnational paper loblolly pine plantations and our own private woodlots. None of the commercially available transceivers can punch thru it all, especially when its wet. Looks like there's a problem with my Hughes.net satellite dish when it gets wet too. I called after the last hard rain, over a week ago, they said they'd get a service rep right out. I heard from him on thurs finally saying he'd be out next tues. Its a hundred mile drive, so its not somethign they like to do often.

I need a piece of equipment I can maintain myself and deal with the server end when I go to town shopping. Its only been in the last 5 years that Alltel in Searcy county replaced *rotary dial* with touchtone. Til then, the "Welcome Home" community fire dept had a party line. If you know what that is. The sheer backwardness of many rural areas makes low frequency transceivers necessary. I dont blame them; its damn expensive to bury cable when you need 3000' foot per customer. When I first got on line, I hadda run a mile of my own cable.

With 12db tuned yagi on each end, I should be able to cover the distance with only a few watts. It aint like it'd be walking on anything anyone else had, and it aint like the FCC is gonna bother sending agents all the way out here to try to find my setup. They couldnt even find jerks in major metro areas putting 1000 watts on a CB channel. We usta hear them walking all over our own neighborhood rigs in the woods.

All the folks in town have DSL; that leaves only maybe 15,000 spread out over 1250 sq miles of hills. And of those, with 4/house, less than 4000 PCs that mite possibly want to be online on about 200 acre farms each. Scattered in all directions. With the directionality of tuned Yagi, nobody would be interefering with anyone else's signal. Arent there notch filters that only accept a few megahertz? And pulse detectors that'd recognize clipped sine wave peaks for zero and the normal amplitude as one?

Hi Glenn!

First of all, thanks for the really nice and informative reply.

So basically, what you are saying, is that we only need I or Q to demodulate
AM or FM. Is I and Q then only needed to cancel out the other image ?
What I would still like to know is, does the same 6 dB rule come in at the case of FM
and AM ?

This area of ham radio is one of the most exciting things I've been playing with.
I started with earlier mentioned polyphase network receiver few years ago and that
encouraged me to go further. Yesterday I tested the TX of my SDR and it worked
immediately, giving out 85 mW with nothing else that the exciter itself to a 50 ohm
resistive load. Very impressive!

Thanks,

Janne - OH1GTF

What you really need to do is to convince your local power company to
do what Israel Electric did. A long time ago they figured that BPL was
not worth it, but their right of way was. So they ran a fiber optic network
along with their power lines and use it to monitor and control their
distribituion equipment.

If they ever can get a license to sell Internet access, then they can just use
the fiber optics.

As for the local telephone company just upgrading from dial service, isn't
there a fairly large tax in the U.S. to support providing telephone
service to rural customers? Where did that money go?

Geoff.

hallo

It seem to be a issue
to the famous TV serie mythe busters
Seen the amount of respons it seems to be a hot item
i like discusions to learn things and broading my range of vision
also to know people of other backgrounds

can amateurradio blow up cars and/or its equipments ??

the today cars are crammed by electronics,sensors boardcomputers etc
is this equipment BCI free a simple case of BCI may casue a serious accident
by blocking a aboardcomputrer.
who is responsible the cars industry by ignoring the bci problem
or is the transmitting ham

Nelson's question does bci in cars exist ? Yes it does many examples
even trafficligths included

It seems to me that manufactories know the bci problem.often pcb's have
already holes for the needed components who is responsible

The bci problem has a profit too!! I live opposited a snackbar yougsters in
their cars equiped with stereo amp's loadbawlers and their 130dba
bonky bonk music
A 100watts carrier stops that (not always)

nelson asked what 's the fieldstrongth of RF that effects carequipments
I have heard that a resaerch institute somewhere in SM or OZ has discovered
a strange effect into a TV set sensibillity to bci and tvi was tuned to the
amateurbands by manufactor !!
So the radioamateur had to solve the problem and not the manufactor !
I hope to see your response

Hallo you ll'
Again a nice discussion and a lot of aspects
CWing or not or another information code
From historical point of vieuw CW is the oldest and in my opinion the
reliablest
and CW was a boarder between HF and VHF
caused by brain damage i can concentrate on the recieving dittery dah dit
of the morsecode
and so became the morsecode a boarder betweem different kinds of
radioamateurs
practice cw was a license the use unmanageable power
practice cw became the roots of the QRPers
CWers became a elitegroup of amateurs however they did nt understand the
basic goal
after cw proof they rapidly forgot the code and have boasting on DX
and when they met an antenneaproblem they let solve their problem by the
techinical VHFers
SO be a "better " amateur however what is better contacting or
understanding
55 and 73 de ruud PA0RAB

Hi Janne,

Yes, IQ receivers are fun. We typically use the complex frequency domain to describe their operation, and in that domain they are very elegant.

I just want to correct a misunderstanding: I or Q alone are not sufficient to demodulate AM or FM except in the special case of AM mixed so the carrier amplitude and phase are exactly at DC 0 volts. You need both I and Q together just as you do to reject unwanted sidebands in other modes.

My previous post was meant to say that it doesn't matter if you mix an AM or FM signal to baseband or to some audio IF such as 20 KHz, as long as you have both I and Q a software algorithm to demodulate it is possible.

73,
Glenn

Sorry about not deleting unnecessary stuff in the last post--

AM and FM behave the same as other signals in an IQ receiver and if you use I or Q alone they have the same 6dB loss I mentioned. You can receive and demodulate AM and FM using only I or Q alone, but just as with other signals you need both I and Q together to be able to reject the unwanted mixing sideband and to recover all the power from your desired signal.

> FM is done?

I and Q give you phase information; sqrt(I^2+Q^2) gets you the amplitude of the signal. Now... AM is not phase-modulated, right? So **assuming you can synchronize your carrier to the incoming carrier**, "I" will be the original signal and Q will be zero, so sqrt(I^2+Q^2)=I --> poof, only I needed! If you chose Q, you'd just get zero (ideally) out of the receiver... but since you're presumably in control of the local oscillator, you can just advance or retard it 90 degrees and now Q is in-phase with the signal and I is zero. Hence AM can be made to work with either I or Q... although it's not really recommended, since -- if you have an IQ demodulator anyway -- you can build SSB receivers as well, which is useful.

The tricky part is that "synchronizing to the incoming carrier" bit: If the receiver and transmitter have the exact same frequency but phase offsets of X degrees, the result is that I receives the original signal mulitplied by cos(X) and Q receives the original signal multiplied by sin(X). (This is just the general case of what I described above where things were 90 degrees out of phase.)

Notice that phase and amplituide, while connected by phase=arctan(Q/I) and amplitude=sqrt(I^2+Q^2), are two separate, uniquely "identificable" "things" that you can transmit. This is taken advantage of in, e.g., "compatble" AM stereo broadcast standards: In Motorola C-QUAM, for instance, I is set to 1+L+R whereas Q is set to L-R. If you run through the math, the amplitude of this is not 1+L+R, but it is "close enough" if L-R is relatively small, and hence compatibility with traditional (envelope) receivers is maintained, while allowing a synchronous receiver to dig out the full stereo information.

There are plenty of solutions presently available, you're just saying you don't like the price tags attached. That's understandable enough -- and there is certainly money to be made if you can come up with cheaper solutions.

> Right now, I'm using the satellite data from hughes.net. Its not the
> high speed bandwidth advertised.

If you call them up and offer to pay lots of extra money, I'm sure they can fix this for you. :-) Still, satellite bandwidth is expensive -- even the military tries hard to avoid using them except in situations like yours, where there simply is no other easy way to get data in and out of a remote area.

You can get short (~6") "extension cords" that fix this problem (see: http://www.cyberguys.com/templates/searchproducts.asp?categoryID=35), or you can get a power strip that has some of outlets spaced for wall warts. Almost any store today will carry those.

> I've tried the 900mhz wireless transceiver. which needs a clear LOS
> (Line of Sight).

Only to get the maximum range. :-) Granted, the difference in usable distance between LoS and "straight through a bunch of trees" could be 100:1.

> I like living in the woods; and I'm not going to
> clearcut just so I can get a clear line of sight to the ISP
> transmitter tower. Hello?

ISPs are a business; they're not going to provide some "alternative" solution for your needs unless they think they can make money off of you. This is one of the things you have to accept when you chose to live in a remote situation -- *everything* gets more expensive, and some things -- like high-speed Internet access -- do so quite disproportionately (you know, this is kinda why the whole idea of "towns" was invented in the first place? :-)). Think back to only 10 years ago, when trying to get a 3Mbps Internet connection in a big city would have run thousands of bucks per month -- today it's about $55!

You might write your local senator or representative and ask that they pass some "rural high-speed Internetification act," but I wouldn't get my hopes up. :-) (Like the REA many years ago...)

> Besides, seems like there mite be pulse emitters/detectors that work
> at this speed. No Carrier wave, no IF. Technically, its *NOT*
> "radio".

It doesn't matter what you call it, the FCC regulates it. The pulse systems you describe are similar to how UWB (ultrawide bandwidth) radios work, and they're very much regulated by the FCC.

> I guarantee you that if you start transmitting high-speed pulses and a high
> enough power,
> Ordinary tuners would ignore it; it aint AM nor FM.

This is highly unlikely: A high enough power pulse will certainly show up as interference to any other radio system, even if it is just a brief "scratch."

> A 12 db
> antenna would be about 13' foot long. Awta go 30 miles to an ISP in
> some town that stays up serving users on the weekends. I've tried all
> three of the local small town ISPs, which have a nasty habit of
> crashing on friday nite, and not coming back online til monday
> morning.

Well, hey, more power to you if you can get it working... but don't coming crying to us if the FCC does hit you with some huge fine or a group of vigilantes spikes your coax and blows your transmitter.

> I called "support" one time to bitch, and mentioned that I used Linux.
> The response: "What's Linux?"

That's not surprising. Especially in a rural area, I suspect the number of Linux users is probably well under 1%... you might as well have called them up and asked if you could use your Atari ST with their services.

> But what's the best option to go from full duplex into the PC? will
> the standard LAN multiplex at 180mhz?

Define "standard LAN?"

In general protocols like Ethernet perform poorly when connected directly to wireless links: Being originally designed for wired systems, the protocols assume a very low bit error rate, which is exactly the wrong assumption to make for a wireless system. Hence, the throughput tends to drop like a rock unless you have a completely "solid" link.

I think you'd be best off doing the following:

1) Lose the attitude. It isn't helping you and just turns other off; you'll receive much better responses if you simply state your situation and what you're after rather than disparaging so many things, even if they do deserve it (save that for after it's all working and you're kicking back with your friends at a bar).

2) Plan on building yourself a tall tower such that you can mount a microwave dish on it and hit a tower back in town. With WiFi at 2.4GHz, 30 miles is probably a stretch, but at least you'll find there's a *lot* of support for people doing it... and the equpiment to do so is reasonably inexpensive. You'll still be looking at thousands of dollars here -- perhaps >$10k --, but if you have a, say, $250k home, just pretend it's part of your mortgage. :-)
3) Start visiting the nearest neighbors you *do* have. Many of them would probably be interested in high-speed Internet access as well, and many would be willing to contribute financially to your cause. Additionally, you might consider doing some "mesh network" sort of approach, so that your signal only has to make it to the next house, which relays it to the next house, etc.
4) If you get an amateur radio license (quite easy these days), you can legally start pumping enough power at 2.4GHz that 30 miles will become easy. This makes your Internet connection easy, although it then subjects the content of that connection to all those amateur radio rules about not using it for fiduciary gain, encrypted communications, etc. Many people will not be unduly restricted by those rules (it's still OK to, e.g., buy stuff from Amazon.Com... at least if you avoid the https: site? -- it is a little dicey here).

Good luck... let us know how it goes...

Or it takes no real skill to go to the hardware store, buy a cheap extension cord, and a replacement plug, then cut down the extension cord and put the new plug on the bare end of the short pair of wires that go to the female end of the extension cord.

Of course, I only started doing that after I was using a full length extension cord, that I carefully rolled up and tied. Actaully modifying the extension cord was just to make it cleaner.

If you have frequency lock but not phase lock, the phase detector in a
phase locked loop will output a DC voltage proportional to the phase
difference. When using the Q multiplier as a phase detector, just
adjust the oscillator phase to bring the averaged Q output to zero and
you will get the demodulated signal from the I multiplier.

Costas loops have been used for AM detection, so you might find some
ideas from that direction too.

>transmitter tower. Hello?

For usable throughput at reasonable power you definitively need the LOS path.

To get LOS, all you need is to move your antenna high enough. Towers up to several hundred meters high are available commercially. Less reliable solutions are flying the antenna under a kite or a balloon.

If this is too expensive, I would suggest moving to a more densely populated area. You will have to find an optimum for the cost_of_land + cost_of_telecommunication.

As others have suggested, it might be enough if you have a LOS path to your neighbour and they have a LOS path to their neighbour and finally one neighbour have LOS contact to the ISP.

One other solution would be to move a repeater to a hilltop visible both from your site and from the ISP, but there is the problem of powering it. Solar cells might be an option, unless you live North of the Arctic circle or the sky is cloudy all the time.

A passive reflector at the hilltop might also be possible, but this will require very narrow beams, which will require large antennas at both ends of the link, in practice in the upper microwave bands or even IR or visible light. However, at these frequencies clouds etc. will disrupt the communication.

Good post, Joel. Let me emphasize some more simplistic points
for other readers:

BOTH I (in-phase) and Q (quadrature) carry the SAME amplitude
variation as modulation, ergo the AM information can be taken
from either one if desired.

Selection of sideband for AM uses the phase DIFFERENCE between
I and Q that, combined with a wideband audio relative phase-
shift network in a linear (algebraic addition/subtraction) mixing
circuit (just op-amps), selects the desired AM sideband.

>The tricky part is that "synchronizing to the incoming carrier" bit: If the
>receiver and transmitter have the exact same frequency but phase offsets of X

>cos(X) and Q receives the original signal multiplied by sin(X). (This is just
>the general case of what I described above where things were 90 degrees out of
>phase.)

Heh, heh, while a concise statement of what it is, the above
is going to be a snow job to those not familiar enough with
more-advanced math. I know it got me a few decades ago and
I just finished explaining that to another last month (off-
line with the advantage of some scratch paper to show the
relationships).

Locking the AM carrier to the local detector sub-circuit
oscillator can be done by simply running the whole IF
signal into a LIMITER to blot out the sidebands. The resulting
limited carrier is then used as a reference to lock the local
(detector) oscillator. "Lock" may be simplistic since the
old Motorola MC1330 video detector simply limits the carrier
internally, uses a single L-C external circuit to keep the
internal I and Q references at quadrature, and the two
internal "product detectors" output is linearly added
internally. Blessedly simple circuit, just one 8-pin DIP
and a very ordinary L-C that isn't critical in tuning. I used
that in a bank of 8 pulse detectors having carriers up to
62 MHz with no problems (even crammed into a thin space).

FM detection by similar, but NOT identical means, to AM.
The modulation equations for FM and PM don't allow that
similarity since sideband content is not really close to
AM. That is done in the more familiar "ratio detector"
or "quadrature detector" (sometimes an alternate name)
found in consumer electronics SOCs for FM receivers.
Try as I might this morning I couldn't put together a
text-only simple description of how that critter works. :-(

"Synchronous detection" of AM can be done on the same
model of the internals of the Motorola MC1330 IC with,
perhaps some more finesse applied to the detector's
local oscillator to remove some of the noise on low-level
input signals; not a terribly-important thing nor precise
since the oscillator's lock DC signal can be lowpassed
to around a half-second time constant in the loop filter.

>hence compatibility with traditional (envelope) receivers is maintained, while
>allowing a synchronous receiver to dig out the full stereo information.

C-QUAM follows the FM Stereo system where the demodulated
audio is the sum of Left plus Right. One hears (directly)
both sources for monophonic audio. The supersonic audio
carries Left minus Right audio. Linearly added and
subtracted, the Left plus Left and Right plus Right gets
the individual "ears" separated. The C-QUAM audio does
have a slight stereo distortion on odd selective conditions
that favor one sideband over another locally, typically
the effect of electric power distribution lines close to
the receiver site. Typical on my particular street. :-(

Many textbooks and professors tell you the "bad news" about a phase difference and that unwanted cos(theta) term... but they seldom mention that what "I taketh," "Q giveth," and that you haven't actually lost anything yet -- if you have both I and Q available -- just because you aren't phase-locked. I suppose this is because, at that point, most textbooks are still hundreds of pages away from discussing I-Q methods.

A lot of the texts make quite a mire out of the whole "arbitrary band-limited signal impressed upon a carrier" bit. I think most people are almost better off ignoring it initially (it seems to come up within the first few chapters in many texts!) and then coming back to it once they have a good "feel" for how phase modulation techniques work.

Alltel used the money to put up the cellular transponders along US 65
& in Harrison, its largest shopping zone.

Compare the population density of Israel with the Ozarks. Lotsa folks
beside me, still have property beyond the grid. That's much of why
folks move out here; they want to get waaaaay back. There are lotsa
places you can go outside at nite, and if you turn out the lites, its
totally pitch black because there are no other lights in any
direction. Lotsa folks own real estate entirely surrounded by
National forest, family farms that were never bought up.

There are simialar regions in the Rockies. I even read about a 'net'
that used packet radio spread across hundreds of miles of mountains.
Canada, Siberia, Australia, and other regions are also way too thinly
populated to afford anyone running cable.

we all know what lightning sounds like. The Titanic had a similar
"spark transmitter", Not that different from the spark coil in a gas
engine. I can see designing a circuit with a resonant tank to produce
a pulse with a wavelength matching a tuned Yagi. No carrier wave. No
frequency or amplitude modulation. And without being hooked up to a
tuned yagi pointed in the correct direction, none of the AM/FM/TV
tuners would pick it up. No IF either. A continuous train of pulses
would look like a carrier wave, but that aint what *data* is.

If, for instance a "1" is a postive pulse, but a "0" negative, and the
sequence of 0100011101010100110.... keeps changing, as it would with
data, then tuners would ignore it. There's no sin wave. Zeners have
been used in surge suppressors rated in nsec and I've seen sin wave
illustrations of the circuitry in psec intervals. Seems like something
mite be done.

Anyone know the data rate on the IR inputs on mthbds? Seems like the response time on IR diodes is pretty quick too... Feeding the mthbd with whatever came in an IR detector would islolate it from the antenna in case there really was a nearby lightning strike.

Of course, I already had the power strip. My point was that the power supply was designed by engineers who didnt think about where it would be used. I have other power supplies, like for the printer and scanner that have both input and output cords that dont crowd out anything else on your UPS.

And of course, part of the reason I ended up living out here was that it was so cheap. Even now, land can be had for less than 1000$/acre. Hardly any of the real estate ads are for homes & property over 250k. Lotsa other old hippies in the woods who never made much money, never will, but we can afford to live here.

There's lotsa 34 ft TV antenna masts laying around behind the barns since folks put in the dish TV. Lotsa 12' foot booms for Yagis too, to be had for scrap metal prices.

I can see where you all with your licenses and equipment mite be worried about the FCC, but not out here. Its 100 miles to Little Rock if you wanna take a Ham exam. Why should the bureacrats runnin the FCC these days be any more competent than those running FEMA or The VA? And if I make this thing cheap enuf, there wont be any *money* in it for them coming out to get me. My ass aint worth anything, and I dont have clear title to the land. All they'd get would be 20$ worth of scrap metal.

Back when we used CB radios to talk to each other, we bitched to the FCC about jerks in urban areas putting *1000* watts on a CB channel. Where was the FCC then? No, man, out here, we are off the radar map. I dont expect any help from the Arkansas public service either. We dont have the votes, and we dont have the money, so they dont care what we do.

The way electonic parts prices have fallen, it'll prolly cost me more to put up the antennas. And without a tuned yagi, none of the commercial tuners will pick up anything. If anyone has a more appropriate forum to raise these questions in, I'd be grateful, and quit bothering you.

I very much doubt that -- it's much more likely they simply decided that saving a little money was worth more than adding a little user convenience.

> And if I make this thing cheap enuf, there wont be any *money* in it
> for them coming out to get me.

Again, I disagree. If you make it so cheap it really catches on, sooner or later it *will* be used in an area such that it intereferes with someone with deep pockets and you'll get sucked into a lawsuit. If you're going to so flagrantly ignore FCC regulations, you should simply publish *plans* for your design so that you can't personally be convicted of selling non-type-accepted equipment... unless you do want to have bars for windows for some time. :-)

> Back when we used CB radios to talk to each other, we bitched to the

The FCC does still routinely bust retailers for selling CB band linear amplifiers and rigs that can transmit outside the CB frequencies.

I still think your best bet it to use 2.4GHz WiFi gear linked "house to house" with cheap dish antennas on towers. Get that amateur radio license and you can legally run enough power that you'll easily make the distances, and no one will question why it is you're buying, e.g., 10W 2.4GHz amplifiers. Those dish antennas are probably going to be a lot cheaper than a bunch of Yagis anyway...

The FCC allows 4 watts EIRP for fixed point to point WiFi links. At 2.4gHz this is a lot of power, usually created by focusing the output of a regular router or similar device with a small dish or Yagi.

For example, the well publicised "Pringles Can" antenna can be easily modified to put out that much from a 100mw source. You need line of site, but if you figure a two routers, antennas, wires, etc can be purchased in the U.S. for less than $200, you can set up a whole relay system.

The latency will be much too high for VoIP and video conferencing, but websurfing and file downloading would be fine.

Geoff.

737. G3SBI H-Mode Mixer as tested by PA3AKE

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-03-07 14:58:53 UTC
From: "Gian, I7SWX" <i7swx@yahoo.com>
Message-ID: <1173279533.001325.160260@8g2000cwh.googlegroups.com>
Source record: 8226

Hi All,

If you like to know more about D'MIXER that removed the mixer from the most critical stages in a receiver see what Martein Bakker, PA3AKE, has just published; a magnificent document regarding his evaluation of Colin Horrabin's "H" mode mixer under various test conditions and using many different transformers and active devices. He spent thousands of Euros on proper test equipment, and as many hours obtaining his published results. This is the real way we should do measurement but certainly it requires a lot of investment in $$$$ and working time and also knowledge. Martein's document has a lot of pages with a lot of information and it is a good reading for peoples that know what he is talking about and also for people that want to learn. This is a sharing of information and knowledge that sometimes is missing in our amateur radio environment. As Harold Johnson, W4ZCB, stated: I commend the read to your attention, LOTS of meat in the pages. You can get the document at:

http://www.xs4all.nl/~martein/pa3ake/mixers-overview5.pdf

I am sure you will see that Harold is right, there is a lot of meat to chew and digest too. The comparison is not only associated to the FST3125 switches but there is a very interesting comparison with modern video switches.

A good friend of mine, Eraldo Sbarbati, I4SBX, has done a similar work during 2005 winter. A lot of work. He has made tests on commercial mixers and then on the H-Mode with the 3 transformers (G3SBI original configuration, used in the CDG2000) and the 2 transformers (I7SWX simplified version, used in the STAR) using various balun cores (size, material and turns configurations) using homebrewed transformers. He has also checked where the mixers loose the 1:3 ratio. I4SBX has started the publication of these reports in the Italian Ham Magazine RKE, Radio Kit Elettronica, since this past summer. The final two articles fully dedicated to the H-Mode Mixer, with particular focus on the two transformers version, are expected to be published in the March and April 2007.
Eraldo's tests include the divide by two (74AC74), and fundamental squarers (using 74AC86 XOR and LVDS receivers). The comparison is also referred to the super CDG2000 RTX, front end and post-mixer roofing filter.

It will not be possible to make the translation from Italian into English of all six issues due to copyright and the work required. I will discuss with I4SBX any possibility of publishing a digest of his work, including his tables and graphics produced using the N2PK VNA.

You will be kept posted ... if ...

G3SBI H-Mode Mixer invention has still a lot to give ... Thanks so much Colin!

73 and enjoy PA3AKE's document.

I'm designing a box that will use four SA605 receiver/mixer chips that all need the same crystal reference. Even with all the good application notes for the SA605, I'm not sure how to do this. Do I build a Colpitts oscillator from transistors, buffer it, and then use this output as an "external LO" for the mixers? Or do I connect up the crystal to the SA605 oscillator pins as usual and then tap off of this for the other chips? Using a function generator as an external LO, I get the best results injecting a 300mVpp sine wave, if that is useful.

Thank you!

Even if its cheap, it aint *easy*. a 180 mhz Yagi on a 30 foot pole
compared to the soup can users would take to in shorter range high
density regions where they need more channels.

But in any case, whether you all know the technical issues or not, I'm
not going to get that feedback here, so I'll quit bothering you.
My address is 1984 Kirkendoll rd, Clinton AR, 72031. you have my email
addy. send it to the FCC for all I care. That's how much I think they

will give fuck what goes on out here. Besides, there is a whole world out there of remote areas that are not served well beyond the reach, whatever that is, of the FCC or their ass kissing agenda to big media. It this takes off, by the time the FCC figures it out, it'll be like trying to get CB users to register. <snurk>

Hi Ed, good information.... I have replaced the 2nd mixer in an FT1000MP with an I7SWX 2 transformer configuration, plus reviewing the 2nd IF gain and .... the user (contester and DX man) is so happy he does not want to send it to a friend for review... hi!!!

Hi Allison,

you are right. The H-Mode is not only a mixer for receiver, it is also for transmitter. The H-Mode Mixer is bi-directional so you need only one in an RTX.

BTW, when you here my good friend Art, K1GBX, say hello to him and his xyl ... tell him you did work me on 50 MHz ...he will get crazy...at me ... hi

Amongst other things it depends on the freq of the LO, the physical
distance between the SA605s.

What freq is the LO ?

How far apart are the SA605s ?

That doesn't appear to be nearly so much in the "boonies" as I would have thought. As the crow flies you're only something like 5 miles from I-65, right? I'd predict that within a decade you'll be able to come up with some reasonably high-speed, reasonably cheap solution based on the cell service providers rolling out high-speed data services along the interstate there, if you don't already have the option of getting a cable modem or DSL just as soon if you're willing to pay for the cable back to highway 16.

Has anyone attempted repair of said YIG Ocsillator sealed assembly ("A6")?
in the HP 8558B Spectrum Analyser? If so, were you successful?

My copy is putting out -32dbm (spec is +15dbm); otherwise seems fine: sweeps
OK, freq is right on, etc.

I suspect the 3 transistor amplifier inside the sealed assy.

Any suggestions?

-georgeK KB1HFT

749. Re: PowerSDR, SDRADIO etc - demodulation possible using only I or Q, why?

Huge thanks Glenn, Joel, Paul and Len.

I had to read your mails 'few' times before I fully understood the content. This subject acutally isn't anything you read at coffee break at work within 5 minutes, hi!

I'm gonna stick of course with the IQ instead of using only other component since I've build and IQ transceiver :) I was just pretty amazed that I could have clear FM or AM audio out just by using one component, but immediately notice the 6db change. But now, it's clear to me, there's nothing special in that. The same amplitude can be found in I and Q and OF COURSE we can demodulate AM or FM without the second component.

Actually, Joel, your answers were pretty good for me, even with the "more advanced" math, like Len said, hi. At first glance, I couldn't get anything in to my head, but reading it few times more started to reveal the math behind the whole thing. I'm really looking forward to get more into the math and understanding the IQ demodulation and modulation.

I had very good succestions even for the hardware stuff, but I think I'll stick with the IQ rx/tx I just made. Actually, those HW ideas also gave new aspects of thinking the way how IQ signals can be demodulated in software. I also liked the C-QUAM information. Really nice, because I didn't knew about the whole C-QUAM -thing.

Wildest dream would be of course, FULLY understand the demodulation of any common modes and write my own software, but I've just done some non-FFT releated stuff with Visual Basic, so not so promising :)

I want to thank everyone for the comments and advices, I had more than I've read so far from the articles laying around the internet. Always when ppl are talking to ppl, they communicate, but reading from the books, that's just trying to figure out what a heck has been in the mind of the writer. Ok, depends on the article, some might write in a more common sense.

Just on question more: If I really want to dig into the math thing of IQ modulation/demodulation, is there any articles you would like to succest? I mean, I've never been that good in high tech math, so at least the beginning of the article would have to be understood with 'basic' math.

73 de Janne, OH1GTF

PS. Yesterday my friend OH1CO brought RFspace's SDR-IQ transceiver to the club (club evening) which he just bought. At our city club, we have only 80m dipole hanging on the trees, but that didn't bother us, we could copy wery interesting station on all bands at HF, all over the world. I'm a 'bit' excited! I also received PSK station all over the world @ 80 meters, with just few meters of wire in my shack (powersdr and digipan).

> How many of you have built or building a Paraset WWII Spy radio?

I must admit I'd love one to own, maybe a kit version could be made up? same size and similar controls but made on a PCB to make assembly easier? I have only seen one tranciever ket recently, valve based and that was using a single all glass valve and had space inside for 10? PP3 9v batteries.

I think a 'modern' Parset 'kit' with a mixture of new and old components would sell quite well. I am sure it could be designed to run on 12V and use some clever circuitry to produce the required high tension voltages. Maybe a double sideband version for the no-code'rs too.

I think one of the biggest problems you might encounter is intermodulation between mixers.

If a strong signal is present on any of the mixers, it will intermodulate with the oscillator due to imperfect balance in the mixer. If these intermodulation components get into the other mixer LO ports, it might cause spurious responses.

Try to build some port-to-port isolation into the LO splitter, either resistively (if you have power to spare), with a magnetic or LC 'hybrid' of some sort, or vith individual buffer amps for each stage. If you choose the latter, common base amps would be a good choice as they have very high reverse isolation. Avoid ampliifiers with feedback, as feedback usually ruins reverse isolation.

The board layout is now 90% complete. This project is certainly ahead
of schedule at this point. If things keep going this well... the
product release could be before the target Sept07 date.

My Ranger driven 813 modulator is working very well but now I want to move on to a self-contained mod.

I have ordered a 15 W solid state amp but need some help picking a transformer for between it's 4 ohm output and the 813's running as triodes.

I am sure this has been done many times so perhaps someone can save me the pain of trying to determine the impedance needed for the output of the trans.

Thanks,

JACK K9ACT

Thanks, Joe. Mark, The frequency of the LO is 13.105MHz. The mixers
are all closer together, on the same board.

Here is another response I got, for general information:

"That's what I'd recommend... a Colpitts or perhaps a Vacker, followed
by a robust buffering scheme, with some isolation (resistive 3 dB
pads, and/or separate second-stage buffers) to drive the individual
mixer chips. Less chance of interaction between the SA605s that way,
and (from what I've heard) you'll probably get a cleaner LO signal
that way.

Design and built the oscillator for best performance. That usually
means not driving the crystal too hard (don't heat it up or overstress
it), and not loading the oscillator itself too heavily (doing so will
lower the Q and reduce the stability). The designs I've seen with the
cleanest behavior have a fairly gentle drive, and then use a JFET or
MOSFET as a first-stage buffer so that the tank circuit has negligible
loading on it. Then, add a second-stage buffer (2N2222 or 2N3904 or
something like that) and at least one stage of low-pass filtering, so
that you get a nice clean sine-wave out. (or, if you're driving a
switch-mode mixer, drive a squaring circuit of some sort). Then,
figure out how much voltage and drive capability your signal has, and
set up resistive-divider networks which will attenuate it down to the
desired level to drive your mixers, and let the mixer "look back" into
a 50-ohm source at all frequencies - this helps reduce spurs. [This
is pretty important in diode-ring mixers - I'm not sure how critical
it is with Gilbert-cell mixers such as the SA602] Of course, you could
always use another SA602 just as an oscillator, and then tap off /
buffer / divide its output to feed the other SA602s. That would still
give you good isolation between the SA602s and might be simpler (but
perhaps more expensive)."

Janne,

I'm about to order an SDR-IQ board. I thought it was just a receiver.
If it's a transceiver, that's a big bonus.

Realy bad marketing strategy.
Very poor product survey.

I hope that you are not contemplating filling any patents on this
product? With this announcement anything filed after March 9th are no
longer valid. I also hope that any copyrights and products names have
properly been filed. Ot herwise you are out.

These are sealed, and even if you could open them,
you don't have the tools or parts to repair. Check
the power supplies and contacts on the bias board,
but this is a common failure mode (blown power amp).

Google "Telstar Electronics" and you will see that he already has that
problem. He seems to apply his 'head-in-the-sand' business methods to
all aspects of his business. He thinks that living in his parents'
basement will protect him from legal responsibilities, but here again
he's ignoring the fact that running his scams out of their house makes
them partially responsible, both legally and financially. His blatant
disregard of civil responsibility is enough to bring up the question
of what else he's doing in that basement for a quick buck..... making
bomb timers for terrorists?

Wild guess: in pentode mode, a PP pair of 813's in AB1 needs approx
160 v peak-to-peak to develop 250 watts of power.

15 watts at 4 ohms is about 20 volts peak-to-peak.

So you need a voltage step-up of 8 or more, round up to 16 for a
little headroom. Don't round up too much or you'll lose some current
ability. If you're looking for impedance ratios they are voltage
ratios squared, so 1:64 (250 ohms, sounds low) to 1:256 (1K ohms,
about right). Note that 600 ohms is a commonish value, you're in luck
if it has a center tap!

As a sanity check, typical 811A (high mu triode) class B pairs take
about 10 watts at 1000 ohm impedance for driving too.

Generally the voltage ratio is more relevant than any impedances
printed on the transformer. If you find a hi-fi or 70.7V PA
transformer that's great, but lots of people have pressed filament
transformers into use too. A center-tap on the output side (even if
it's really the input side!) is really nice, you'll note that
"international" filament transformers have two 120V windings that can
be put in series for 240V or in your case to make a center tap.

My question for you: what kind of modulation transformer do you use to
drive the plate for the 8000? I'm jealous that you apparently had one
just sitting around :-).

Tim.

As others have pointed out he should name him business and products
more appropriately.

Telstar should be......Tespam or Telstar rejectronics for obvious
reasons.

Skywave should be...... LieWave for its exaggerated specs.

VoiceMax should be......VoiceHack for his implementation of someone
else's design or VoiceLax for what will ultimately spew from the use
of his product.

Jack,

I agree with Tim's comments, and will add just a few words.

One concern I have is that the 15 watt amp will see a load of varying impedance from the 813 grids. If you are running them Class AB, their input Z is near infinite until
grid current flows. That reflects back to the 15W amp, which may or may not affect it.

I suggest putting a resistor across the secondary of the driver transformer, so the amp always sees a load. The resistor then sets the impedance of the transformer.

Some back-of-the napkin numbers:

As Tim says, 15 W at 4 ohms is about 20 volts peak-to-peak. To give some headroom, let's use 10 volts.

Again using Tim's numbers, figure about 200 volts peak-to-peak at the 813 grids. That's a 1:20 voltage step up, or a 1 to 400 impedance step up.

The output Z is therefore 1600 ohms or so. The resistor should be 1600 to 2000 ohms, 20 W. Could be a bunch of smaller resistors in series-parallel. The 20 W rating is very conservative, too - 10 W may be enough.

Besides the transformers Tim mentions, keep an eye out for Stancor "rectifier transformers". These have been around forever, and have the numbers ranging from RT-201 to RT-208 or so. They are all the same windings, the difference is in the power rating. An RT-201 is more than enough VA for this application.

The RT series are well-documented, common and not too expensive, and have the desired dual primaries (which you use in series to drive the

813 grids). They also have lots of secondary taps so you can try all sorts of ratios.

No such luck but I did find someone else by trolling who did. It's a
UTC SS22 and about right for the job but I would feel more comfortable
with something a little bigger.

I only need about 200W of audio but I would like to run it at 2000 volts
to get legal limit out of the final but I am a little reluctant to push
the mod trans. I am currently running at 1600V and everything is happy.

There is some idling grid current flowing.. about 30 ma if that helps
any. This is a zero bias set up with screens and grids tied together.

It is a standard method of distributing multiple PA or music speakers from an audio amplifier. If you start out with a 100 watt amp with a 100 watt/70 V audio output transformer you can run small gauge wire to the remote speakers. At each remote speaker a 70 V transformer steps down to the speaker impedance by way of a tap corresponding to the power you want delivered to the speaker. If you have 10 speakers, use the 10 watt taps etc.

Hi chaps,

I suspect a neighbour of a friend of mine is using an ultrasonic bird-scarer to frighten off his pets. The man concerned won´t admit to it, but there are times when his dog and two cats just seem to get suddenly very distressed and hypermanic for no apparent reason. I`d like to at least eliminate this possibility before considering any others. So the question is, what´s the simplest way to detect ultrasound? My web research leads me to believe the area of interest is between 20 and 30khz. Most common bird scarers warble between these two limits which are of course above the range of human hearing. I´ve acquired an ultrasonic transducer that transmits on 41khz. If I couple this up to a wien-bridge oscillator trimmed to the same frequency, I figure I ought to be able to hear a warble if indeed this guy is using a birdscarer, because the difference between 41khz and 20khz-30khz will be audible to me. Is this feasible to "air mix" the two frequencies in this simple way and hear a result, or is something more complicated required?
Thanks!

Interesting.

The mixing process requires a non-linear device, which, for your purposes, I suspect the air is not. I've often considered, but never attempted, a similar mixing process using human ears (connected and intact, of course), since ears are quite non-linear. Ears won't work as mixers in your case since, at least for most adults, they are insensitive to ultrasonic frequencies (as well as to intelligent political analysis, it seems).

The suggested bat detector is far more promising.

Chuck

Suspend a thin shaving razor blade between two pieces of dental floss and put
your ear close to the blade. Watch the razor vibrate.

Hi every one!

I'm currently working on a project using SA602A with a 32MHz crystal oscillator. The crystal is specifed with 30 pF load capacitance. I'm not able to make the crytal works. I use 120p and 40p in series, for the crystal.And I follow the circuit given in SA602A data sheet for cellular radio application. Can anybody help me with this one, please..Thanks

The SA602 oscillator ir primarily intended for fundamental mode crystals.
Your 32 mhz crystal is probably a 3rd overtone unit. It will probably
require a tuned circuit to ensure that it comes up on the third overtone and
not on the fundamental frequency. I recall that the Philips app note shows
how to do that.

The obvious "detection" would be oscilloscope observation
of the amplified microphone signal. That's been mentioned.

Some commercial ultrasound detectors simply heterodyne
the ultrasonic range down to audible frequencies...good if
your hearing goes on up to the high end of human response.
Expensive as portable devices but easily genned up on the
average home workbench.

There are a couple of claims of outdoor advertising via sound
through using high-power ultrasound generators in pairs, one
modulated in amplitude the other unmodulated. The air acts
as the non-linear "mixer" and the claim is that such beams
of ultrasound can be focussed on particular locations. One
such company is located in San Diego, California, if memory
serves.

To get the air to be non-linear enough to mix the two frequencies, you would need very high sound pressure levels that could potentially be hazardous (or at least much more of a nuisance that whatever your neighbour is doing). I would suggest getting a wideband microphone (a very small electret might do, and would be less high-Q than a typical ultrasonic transducer), and then attach a preamplifier and an electronic mixer with an adjustable local oscillator (e.g. make a bridge from switches using a 4066 or FST3125 that alternately inverts or doesn't invert the signal). The output of the mixer can be fed to an audio amplifier and headphones. You can then test this receiver if you buy or borrow one of those cheap "pest annoyer" things. Once you know that your receiver works, you could make a parabolic reflector (e.g. spin cast a dish on an old record player from plaster of paris in a bin lid), so that you can search for sources of ultrasound.

Replace the dental floss with Litz wire and attach ends to 110 VAC.

Wait. Maybe not. Considering how many stations you can pick up with a
razor-blade radio, that would probably interfere with vital communications
all throughout the spectrum. What's the resonant frequency of a whisker?

You need your detector to be low Q since you don't know the offending
frequency. Some of these fancy sound cards do 196kHz sampling. A
piezo microphone with amp into the sound card might do the trick.

Also, as other have suggest, the bat detector.

Why not just a mike capable of "hearing" the ultrasonic freqs in
question--feeding an opamp and meter?

Pointing the mike around should lead you into the correct direction and
following the meter reading should lead you to the source(s).

Possibly can substitute a light or even a led in series with a pot and
use a visual indication of strength ...

Come to think of it, wouldn't take much more to square up the sine wave
out of the opam and drop a cmos decade-divider onto that output of the
opamp and feed an ear phone with the dividers output--30,000 becomes
3,000 hz--easily "hear-able!"

Hi Pete.

I have used various handies upto 10w output on 2meters and my IC2800 puts out 50ish on 2 (ant mounted on the roof about 6cm from one of the bags explosives!) and my Toyota Yaris has had no problems with any of its 9 airbags (10 if you count the missus!) so I would say go ahead!

only if theres no other sound present in the mic signal.

and it will give no indication of signal amplitude.

Never even thought about it.
I run 50 or 160 out on 2-meters and 35 watts on 440 in a Toyota
4-Runner. The dealer ran the wiring for me.
My wife's set up in the Prius is a Kenwood TM-V7A with 50 out on 144
and 35 on 440.

I *think* what the OP is worried about is that his friends' pets are being scared off by his freinds' neighbor.

While I hate to discourage anyone from building something electronic, I do have to ask: what will one do if they learn that a bird-scarer *is* in use? Best of my knowledge, they aren't illegal.

If a bird-scarer works on dogs, then I find the details quite interesting. May have to work up a mobile version. Loose dogs allowed to roam a neighborhood are a serious safety issue for cyclists. (and I wonder if that's why the neighbor in question is trying to scare them off?)

Could not have said it better and your comments mirror my sentiments as
well. Thank You

If we are to have fun and let this hobby flourish, we all need to work
together to make it a model of humanity and acceptance. Just because one
has passed code reception tests at some level does not make him/her the
exemplarily model of the perfect ham. Look at all the child like behavior
resulting in massive FCC fines of the past five years! These were all
'coded' hams. Some with 20WPM test behind them. Remember, we (the US) are
one of the last to continue to have had a code requirement. Has the
'hamming' rest of the world gone to heck in a handbasket? No.

If you find it difficult to deal with the no coders, then it may be time for
you to move on to another hobby. I welcome the 'new blood' as this will
ensure our bands remain ours and might even cause equipment prices to come
down - it's all in the law of supply and demand.

> Someone else suggested a resistor in series but I forgot why. Are you
> addressing the same problem?

No. I was suggesting a resistor across the transformer secondary -
from grid to grid. But since your setup is zero-bias Class B, my
concerns don't apply. The 813 grid/screen connection you are using
provides a load
for the driver.

I think the series-resistor idea meant a small (~100 ohm)
noninductive resistor in series with each grid lead, installed right
at each 813 socket, in case of instability. You obviously don't have
that problem.

Hello all,

I was playing around and saw that my junk box had all the parts so I started tossing this together:
http://newenglandqrp.org/files/w1aw-receiver.jpg
The problem is (well I think it's a problem) is that I'm all the way down to a 10pF cap for the crystal trimmer and the highest frequency I can get out of it is still less than 3580kHz. Pleae correct me if I'm wrong, but I'm thinking that the 20uH inductor is supposed to pull the colorburst crystal high in frequency then the adjustable cap should be able to tweak it back down. Higher capicitance does result in even lower frequency. I made the 20uH inductor by wrapping 17 turns on an old amidon FT50-61 ferrite toroid. I don't have any way to measure the inductance, but by my calculations it should be approximately 20uH. Is the ferrite saturating and messing things up? I see that touching the 20uH inductor it will cause the frequency to shift down as much as 4-5kHz.

I believe this is direct conversion and that the crystal should exactly match the desired station (3581kHz) I want to recieve, that's right isn't it? Maybe this is close enough? I have to wait til tonight to see if I can actually hear anything.

I mostly tinker with PIC chips so this is pretty much out of my league. I just wanted to throw it together and listen to the nightly report. It seems to be working as I can touch the 7.8uH coil (40 turns on a T50-2 toroid) and I get increased noise out of pins 4 and 5 on the NE602 (hey it's what I had in the box ;-). I haven't added the 386 yet, I just wanted to test the front end first. I'm cramming it all on a RS 276-259 pc proto board, but the layout is coming along pretty well for not planning it out. ;-) Thanks for helping.

Yes, but the blueing was what made a detector.

Thanks for the reply. I should have been more clear, the desired frequency is 3581kHz so yes I need to pull the crystal up in frequency about 1.5kHz. Right now I'm only able to get to just under 3580. It seems that much inductance should have more effect than moving it up only about 500Hz, but this isn't my bag.

By tank I guess you mean to rid myself of the crystal and use an ordinary LC circuit? I think I can come up with something simple, but I'd rather just get this working if at all possible. Do you have any idea what impedance the 602 wants to see on it's oscillator? I have a couple more chips and I could try and cobble something together if I knew what impedance to target.

Try going smaller than 10 pF (you can put a 10 pF fixed capacitor in series
with the trimmer).

Get rid of the series choke and just use the small value variable
capacitor to go higher in frequency. I believe the inductance will
lower the frequency--the combination works to give an increased
VXCO range if I am not mistaken.

If the series capacitor is very small, the oscillation will stop. In
these circumstances, I have successfully pulled VHF crystals (3rd, 5th
and 7th overtone, between 70 and 200MHz) HF by adding an inductor IN
PARALLEL with the crystal. The value will be somewhat less than that
required to neutralise (ie parallel resonate with) the parallel
capacitance of the crystal. The lower the inductance, the higher the
frequency.
Ian.

You have a capacitor and inductor in series.
Capacitive reactance = -j/(wC)
Inductive reactance = +jwL
The net reactance [jwL-j/(wC)] may be capacitive (negative) or inductive
(positive).

Reducing the inductor makes it less inductive i.e. more capacitive.
Reducing the capacitor also makes the net reactance more capacitive.

You turned your trimmer all the way down to 10pF and it wasn't enough, so
try taking a few turns off the inductor.

Use less inductance or replace it with a wire link.

Dear Joe: My ISP had a serious problem with the news server and only this afternoon have I been able to get to this group.

While my ISP's server was down, I was able to read a slightly garbled copy of your helpful message using Yahoo. Unfortunately, E-mail addresses were smeared. So, I did a Google search for a "Gary" who was associated with RACAL, and eventually had success.

I asked Gary about the 488 codes and, a few days latter, he sent me a well formatted list. I intend to exercise the codes as soon as I get a break and then get back with Gary to confirm/expand on the codes.

This is a long way to say thank you to Joe WA9LAE and to Gary.

I also thank Dan Rae who noted that some of the manuals contain the information.

What does that have to do with dangling the blade from dental floss? Or,
for that matter, what does dangling a blade from dental floss even DO?

Thanks,
RIch

I did this and now I'm up to 3580.050; an increase of about 70Hz or so.. I don't understand how this was designed to work. What is making the crystal oscillate above its design frequency? I thought the inductor had something to do with it, obviously not. Is it being operated in series mode instead of parallel?

I tried putting small cap in series with the adjustable one and that just greatly narrowed the tuning range and only slightly raised the frequency. It seemed to be getting unstable at that point as my old frequency counter started showing variations of quite a few hertz each update instead of remaining steady. It could be the amplitude is too low and the counter is missing ticks.

If you want a VXCO, you use the capacitor and inductor to achieve
maximum range of the crystal frequency.

An inductor in series will lower the frequency.
A capacitor in series will raise the frequency.

Eliminate the coil and just use the series trimmer to see how
how high the crystal frequency can be raised before it becomes
unstable or quits oscillating.

As Ian suggested, you can add an inductor ACROSS the
crystal to raise the frequency. Think of the crystal as being
a parallel LC circuit (over simplification) and you'll
be better able to visualize how this works.

Try a few other color burst xtals in the circuit for the heck
of it. You may not be able to pull the crystal that far.

> Thanks!

If you want to compress the range of 0-30 kHz to something like 0-12
kHz you can do that with a switched capacitor delay chip like the
Panasonic MN3007.

It will work like the bat detector, except it won't need to clip and
threshold the audio. You will need to use a slow ramped VCO
(continually ramping the sampling frequency down) in order to do this.
There are some projects at:
http://www.geofex.com/
You may be able to adapt a flanger, for instance, to suit your
purpose.

The control voltage to the sampling VCO will be a sawtooth wave.
Unfortunately, you will hear the sawtooth period as an artifact in the
output. Maybe you can filter it out.

I guess an all-digital solution is better ;-)

Frank Raffaeli

You have a good memory. MHZ Electronics was dumping
5.9XX USB, LSB and CW filters in full page ads in Ham
Radio Magazine back in the late 70s or so if my memory
holds. I remember buying several of each for future projects
that never have materialized.

Pete

You need to reduce the inductor.. that is causing a down swing in your freq.

maybe the Q of you inductor is too low, try an air core,
needs lots more turns, a trimmer core as a core is good too.

Also you should test it with the crystal shorted,
then when you get close to the frequency you want put the crystal back in.

try a different Xstyle, it sounds like your at the limits..
it's possible the chip has too much capacitance on the
osc legs, i suppose you could try a stand alone osc with a
high freq transistor to lower the cap. use a buffer on the
stage to drive the chip .
Also, have you considered the board mounting? you could
have to much cap via your board construction.

837. Old microwave

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-03-14 01:21:31 UTC
From: jawod <jawod@fuse.net>
Message-ID: <69f3a$45f74f17$d066b697$3793@FUSE.NET>
Source record: 8126

I have an old kitchen microwave unit whose only fault is that the digital readout is broken. As a neophyte homebrew guy (kits only so far...Elecraft K2, etc), Is there anything worth salvaging from this unit?

Thanks!

John

My W1AW receiver uses the crystal with just a 5-47 pf variable capacitor...no inductor, and it nets right on frequency. Try shorting the inductor and see if this gets you closer to the required frequency. Not all color burst crystals were created equal. If you have another crystal you might want to try it.

Your ferrite will not be saturating at the small amount of signal you are sending through it as part of an SA-602 oscillator.

Off the top of my head.......

The HV transformer. Output 1 to 2KV at several hundred to a thousand KVA

HV capacitor 1 to 2+ uF at several KV

HV diode. several KV PRV.

Magnetron..... I don't know what I could do with them, but I keep them anyway. Maybe if I ever get into plasma physics, or building my own fusion reactor, I'll be set.

A thermal limit switch that is mounted on the magnetron.

A set of large magnets that is mounted around the magnetron. The outer magnetron casing can usually be disassembled to remove them. They can be used to make generators and the like.

If you do remove the magnets from the magnetron, don't throw away the actual magnetron tube. With out the magnets, it acts like a normal vacuum tube diode. with a PRV of several KV, and a peak cathode current of up to an amp, a pare of them would work good in a HV power supply. Filament voltage is usually a couple volts at a few amps.

Several NO switches on the door for safety interlocks, and timer control.

A relay, or high power triac for controlling power to the transformer and magnetron.

A light bulb that lights the inside of the microwave.

A fuse or two. Will save you a trip to town if you have another project that blows a fuse at an inopportune time.

Sometimes a smaller transformer with about 4 to 12V ac output for powering the timer/display.

If you are into getting the last drop out of a salvage mission, then you can usually get a moderate number of transistors and diodes off the timer/display board.

The only problem I have found with doing the last thing on the list, is you tear the microwave apart, then the last thing you do is go after the timer board. When you get done pulling all the parts off of it, and you test them to find out what they are. (NPN, PNP........) you find one that is bad.......... Then it hits you........That component ran the this and that....... That bad component is why the microwave wasn't working....... Then you have to decide if it is worth putting it all back together after you find out what died........ I usually don't.

Your color burst crystal is ground to ring at 3.579545 MHz, and if
you try to run it at another frequency you'll run into drive and
tempco problems which will make it worthless.

Looks like you are quite likely correct. Without the inductor and with a 10pF cap in place of the variable cap, I can get the frequency up to just over 3580kHz. I did some looking around and it appears that if I were to parallel another crystal, I could get a bigger spread on frequency. Or I could just try a different crystal too. I think I will tinker on a breadboard to see how high in frequency I can get the crystal to vibrate.

I did this and it will go slightly higher in frequency, but it gets a tad unstable (could be the counter too, I wish my new scope would get here). I guess I'm at the limits of that particular crystal.

It hasn't stopped, but it has gotten weak or unstable (I can't be sure right
now) with capacitance below 10pF.

Are you referring to the capacitance inside the crystal, or the 100pF
external cap? Do you have a ballpark number on the inductance value I
should try?

I understand that, but I don't use values like j and w, just 2, f and PI.
;-)

I took it out, and it's still too low in frequency. :-(Back to the
drawing board I guess.

Ok, just like an antenna

> A capacitor in series will raise the frequency.

Same thing again, just like an antenna. However, when I increase the series
capacitance, the frequency drops instead of going higher. This I don't
really get.

> Eliminate the coil and just use the series trimmer to see how
> how high the crystal frequency can be raised before it becomes

Did this, it helps, but when capacitance is below about 10pF, it seems to
get unstable and I still can't achieve the frequency I desire.

> As Ian suggested, you can add an inductor ACROSS the

Can you suggest a value to start with?

> Try a few other color burst xtals in the circuit for the heck
> of it. You may not be able to pull the crystal that far.

That's what I'm thinking now, it just won't pull that far high. I can sure pull it low though. Maybe I should try a 4MHz crystal and pull it down to 3990, this is where the voice transmissions are anyway.

I know that I'm "violating the specs", but that's the intent here. Most of the circuits I've encountered tend to pull the xtal down in frequency (just add capacitance), but this case is odd in that W1AW transmits just above the colorburst frequency. I can pull it down several kcs pretty easily, I just can't get it above the specced value by more than about 500Hz. I think I just need to try a different crystal or maybe two in parallel. The parallel inductance idea is interesting as well, never done anything like that before.

As for stability, as long as it's not causing warbling audio, I'm not too concerned. :-)

Agree. Even a bog standard electret for $1 will do it - probably
wouldn't even need an amplifier......if you want to get sophisticated,
put it in the end of a piece of 30mm plastic pipe - voila, directional
microphone....

The alternative is you are just being paranoid......but I know you
know that anyway...

Good list we could add:
hardware (screws, washers etc)
mains power cord
some models have motorized wave "stirring" or magnetic drive platter turners
keypad for PIC projects

All in all, there's allot of good stuff in one. I shouldn't have thrown my
old one out.

Its only a pull of ~100ppm, this should be easily pullable for most
fundamental xtals.
ofc if the tolerenace all add up against you you might find it hard.

I would also try reduce the 100pf caps on the sa602 too.
100pf is higher than most crystals I use would like,
50pf or 20pf or if youve got some spare trimmers ...
you can adjust the ratio too, say just reduce the one accross pin 6-7

The inductor will pull the crystal down in frequency, as others have
suggested.

In fact it is extremely difficult to pull a crystal's series resonance
up in frequency more than a few Hz. This is because the crystal's
parallel resonance is just above its series resonance. If you put a
capacitor in series with the crystal the series resonant frequency
goes up...BUT...if you approach the parallel resonant frequency you
can no longer get a low impedance resonance condition since the
crystal's parallel resonance makes the crystal look like an open
circuit, regardless of what you put in series with it.

If you want to understand this better, try to find a reference with a
good discussion of the equivalent circuit of the quartz crystal
resonator. the only one I know of at present is Kenneth K. Clarke and
Donald T. Hess, Communication Circuits: Analysis and Design, Addison-
Wesley Publishing Co., 1971. It may be a bit hard to find outside a
good university library.

As Ian Jackson suggested a parallel inductor might work....this
modifies the parallel resonance. Ian..is there a schematic available
for that ? I'd be interested in what actually worked.

Steve

I figured that they were voltage dividers to set the amount of feedback, but
I can certainly see how they could have an effect. Since I'm close to where
I need to be, I will try a couple of 33pF caps to see what happens.

I understand now. I knew that adding capacitance tended to slow xtals down.
I was unfamiliar with how an inductor would act in series. I knew that this
circuit was trying to pull the crystal higher than spec so I, quite wrongly,
assumed that the inductor would have the opposite effect of capacitance.
And it seems that it does when used in parallel and that seems sensible to
my feeble mind. But in series, it has the opposite effect. What still
throws me is that raising series capacitance doesn't have the opposite
effect of adding parallel capacitance.

Doodling with reactance formulas, it appears that 20uH (coincidence?) would offset 100pF of capacitance fairly well by having a an opposing reactance (well resistance at this point) of about 450 Ohms at 3581kHz, the same as 100pF. I'll try putting the coil I made in parallel and see what happens. Hopefully it won't short the oscillator and kill my 15 year old NE602, I only have two spares.

Should I be afraid to do this? Does it need something to block DC current?

> where I need to be, I will try a couple of 33pF caps to see what happens.

no they are involved in setting the frequency too,
in order for you circuit to work it needs to resonate,
with the 2 100pf the input where the crystal is looks like a capacitor with
some negative impedance,
the circuit with your crystal, inductor, and trimmer must be inductive,
it then forms a resonant ciruit with the capacitance of the input.
usualy the crystal would just be operated so that it looks inductive.

the negative part of the input impedance must be stronger than the loss in
the tuned circuit.
this is affected by the ratio of the 2 100pf capacitors.

a crystal can apear to be a very high inductance at resonance,
at the point where you want to operate it probably has very high inductance
indeed.
you can determnine the eqv inductance by using the equivalent internal
inductance and capacitance. you need to find the mutual capacitance of the
crystal wich is hard to find man specs wich tel you this but it is often
something like 14ff for example.
(0.014pf) you can then work out the eqv series inductance for it to resonate

with the std load wich may be 20pf.

you can then work out what inductance the crystal will apear to have at the frequency you want. and hence the series capacitance you need.
you might find the inductance is so high that you need less than 1pf or it has become capacitive.

the trimmer should block all the dc.
im not convinced about the inductor in parallel with the crystal
it might work though.

Depends on what sort of signal you are trying to receive.

To receive a single our double sideband signal (or, in a very touchy
way, an AM one), you want your direct conversion receiver's local
oscillator exactly on the transmitter frequency.

But to receive a CW signal, you want your local oscillator 700 Hz or
so above or below the transmit frequency. That will cause you to hear
a 700 Hz audio tone for the CW.

Unless I'm mistaken, 3.581 MHz is in the CW portion of the 80 meter
band.
If you can get to 1 KHz below the transmitter, you should be able to
copy CW as 1KHz audio. If you can only get to 1.5 KHz below, you'll
get 1.5 KHz audio... not ideal listening, but probably workable.

Ow ow ow ow..... forgot to mention something.....

Microwave oven transformers (MOTs) are current limiting. They have magnetic shunts between the primary and secondary. You can short the secondary out, and it won't blow any breakers. The transformer may hum loudly, but it but nothing will blow.

That is why people say that they have poor voltage regulation when used in a HV power supply.

You can remove the current limiting by just driving out the magnetic shuts with a punch and hammer. The shunts are just stacks of transformer laminations stacked up to make a square block, and press fit into the space between the primary and secondary.

With the magnetic shunts removed, then the output voltage will go up, and the output voltage regulation will be far better. You will be able to draw a lot higher peak current from it. But be careful. There is no longer any current limiting. If you short out the secondary, the breaker, or fuse will blow.

Anthony

Your trimmer cap will block any DC flow to ground. If you are really
paranoid then put a 0.1 mfd in series with the crystal.

If you do accidentally ground the crystal input terminal on that
SA602, it only pulls the base of a transistor to ground and thus turns
it off. That shouldn't hurt anything.

While you may not be able to purchase new "602's" now (they are long
ago declared obsolete) the Phillips SA-612 is the same unit and is
readily available from a number of outlets.

A datasheet for this device is located at:

http://www.nxp.com/pip/SA612AD_01.html

Arv - K7HKL

Ok, I had to read that a few times to get it. A period between ".....100pf"
and "the input..." there would have been quite helpful. ;-)

> the negative part of the input impedance must be stronger than the
> loss in the tuned circuit.

So they do act like a voltage divider of sorts and shunt some of the
oscillator output to ground and some back to the input.

Cool, a way to figure out just how high you can pull it and how to attain a
certain frequency. I'll probably stick to tinkering though. ;-) Thanks
allot for the detailed explanation. :-)

Doh, I see that now. For some reason I was thinking that they crystal had
both pins connected to the oscillator on the 602, and not with one leg
grounded as the circuit has it. Having yet another senior moment I guess.
Only about the tenth one so far this week.

I saw that 612 part when I was poking around on the net. A fellow ham gave
me three NE602s about 15 years ago. I had fogotten about them and recently
found them. I even have a couple of tuning cap vernier drives he gave me.

aha ok, thats a fair bit, but maybe within range, as as been said at a
certain frequency the crystal becomes a complete open circuit.

Yeah I kinda got lost in my own explanation myself. didnt have much time to
explain.

> oscillator output to ground and some back to the input.

this circuit is an emiter folower wich has no voltage gain,
so actually they operate in the opposite way wich is kinda confusing but let
me explain ...
consider a typical tuned circuit with LC and a tap in the L,
driving the circuit at the tap acts as a step up,
but the crystal is the inductor wich make it difficult to put a tap here,
but at resonance the 2 capacitors can act in the same way and provide a
voltage step up.

but you can see there is a curent loop involving all these components in
series,
this is what sets the frequency.

If you decrease the capacitor accross the 2 pins of the ic this will
increase the voltage accros it and so give more drive, as wel as increase
the frequency.

another way to look at it is if you consider that ground is at the base then
the capacitors are in fact a voltage divider wich feed into the emiter of a
comon base amplifier.

> Thanks allot for the detailed explanation. :-)

The pulling range is usually equal to the motional capcitance over the crystal self capacitance, so for 14ff and 20pf this gives 700ppm, but actually at this extreme its unusable in this circuit as its required to be inductive.

as said by some1 else the farther you pull it the worse the performance.

It is, I mistakenly thought they did the 80 meter voice announcement down
there. The voice bulletin is actually on 3990kHz.

Since I have most of what I need (tuning caps, vernier and toroids/wire) I
started looking around at different VFO circuits. I'm trying to find
something that will span from 3500 to 4000kHz and still be fairly simple. I
could then inject this into pin 6 of the 602 and be done with it. :-)

Right. I was hoping to be able to "get on the other side" of the signal to
have a second chance at avoiding possible QRM.

For CW I don't, but I would want to be able to get on the other side for QRM reasons.

My guess is the project's original author hadn't planned on that...
most likely, they'd planned on rubbering the crystal only far enough
to get a reasonable audio tone from the RF-LO combination.

Obviously you can get more range out of a VFO, though building nice
VFO's isn't simple.

Even the tuning caps can be a pain. I spent a while as a teenager
knocking alternate plates out of old 365 pf AM broadcast caps to try
to make some suitable for 40 meters - or you can use a series
capacitor. Beware hand capacitance when you go to tune it. Today,
varacter tuning is another option - stable regulated supply and a
multi-turn pot.

Another thing you might do is google the "poundshop" (dollar store)
receiver projects. Those are little KHz-IF varactor tuned auto-
scanning FM radios that people have been modifying into direct
conversion ham band receivers.

I think you are getting close to the limits :-) You might get a
few Hz more by reducing the value of the 2 100pF capacitors. Try
another crystal or a ceramic resonator.

I didn't design it, but allot of folks seem to have had success with getting
it working. Like one poster said, I'm already within range to copy the
signal, but it would be about 1.5kHz. That's a tad high in pitch for my
taste. I was hoping to be able to get to the other side of zero beat, but
perhaps that was wishful thinking on my part. I've managed to get it 500Hz
higher than the marked frequency so I should probably be happy with that.
After all it's a crystal and it was designed to be operated well within
50ppm of its marked freq.

It's definitely worth keeping the transformer if you have space to store it, some people make spot-welders or arc welders from several microwave oven transformers, by removing the secondary winding and winding on a new one.

I can't think of many sane uses for the intact magnetron but perhaps there are some, given sufficient safety precautions.

I would strongly advise against applying power to the transformer with the existing secondary winding in place, unless you can be *completely* certain that you won't get a shock (e.g. all components and wiring should be inside an earthed metal box). Those transformers will arc through clothing, will provide more than enough current to kill you without blowing the fuse, and the primary to secondary isolation means that earth-leakage circuit breakers (also called residual current circuit breakers) will not protect you. I certainly don't mean to discourage you from using the parts from the oven but that is one appliance that really could kill you so just be careful.

Chris

I'll try and draw what I have in mind, and post it in
alt.binaries.schematics.electronic. However, in the meantime, let me try
and explain. The explanation may not be absolutely 100% complete, or
even 100% correct, but it may help in moving a crystal more HF than it

wants to go. Sorry that it's a bit rambling!

In Anthony's circuit (http://newenglandqrp.org/files/w1aw-receiver.jpg), the crystal will probably be functioning as a series-tuned circuit.

As Steve has stated, a crystal suddenly goes into parallel resonance just HF of its series resonance. This limits how far the series resonance can be pulled HF by the addition of a series trimmer capacitor. However, if this parallel resonance can be removed (or moved further HF), it should be possible to move the crystal further HF. The technique described certainly does work with VHF overtone crystals (between 50 and 200MHz), but should also work with HF crystals working on their fundamental frequencies.

A crystal is a mechanical device, but can be represented as being a series-tuned L-C circuit. (Call these L1 and C1.) Also, across the two is a parallel C (C2). Forget about losses (represented by a resistor). [Note: L1 and C1 are not actual electrical components, and only appear to have these values at or near to the L1-C1 resonant frequency. However, C2 essentially is a physical electrical capacitor consisting of the plating on each face of the crystal, with the crystal as the dielectric between.]

L1 is very large (possibly 1H or more, depending on the frequency). C1 is very small (say only a few pF or even a fraction of a pF - again depending on the crystal frequency). [So adding a relatively large series trimmer capacitor has very little effect on the frequency.] C2 is typically around 5pF, regardless of frequency.

Imagine doing a test where you look at the resonant frequency of a crystal, using a signal generator. This feeds an RF signal through a crystal, into a 50 ohm load. You measure throughput of the crystal by measuring the voltage across the load.

Swing the sig gen frequency slowly from LF to HF, through the resonant frequency of L1-C1. [Let's forget about C2 for the moment.] Below the resonant frequency of L1-C1, the L1-C1 circuit acts like a small capacitor, so there is very little throughput. Above the series resonant frequency of L1-C1, the L1-C1 circuit acts like a large inductor, so again there is very little throughput. However, when you hit the series resonance of L1 and C1 (F1), reactance of L1 and C1 cancel. The crystal acts like a short-circuit (or nearly so) and there is a large throughput. Because the L-C ratio is very high, the resonance peak is very sharp.

The effect of C2 across the L1-C1 circuit is to produce a second (parallel) resonant circuit. VERY slightly HF of the L1-C1 resonance, C2 resonates with effective inductance of the L1-C1 circuit. This produces a parallel resonant circuit (F2). Another way of looking at it is that L1 resonates with the series combination of C1 and C2 (so F2 must be higher than F1). The parallel resonance is, of course, a high impedance, where there is almost no throughput through the crystal.

As a result of this double resonance, the crystal acts as a series-tuned circuit at F1 (one you want), and a parallel-tuned circuit at F2. The transition between the two is very sudden. The frequency response peak of the throughput is very lopsided, and gets chopped off suddenly on the HF side.

The difference between F1 and F2 is very small (a few Hz to a few kHz, depending on the frequency and type of the crystal). If F1 is lower than you want, and you add an external series trimmer capacitor to try and pull the crystal L1-C1 series resonance HF, you effectively hit a brick wall with the parallel resonance at F2. The parallel resonance will block any throughput at (or near) this frequency.

A possible solution is to neutralize C2.
[Note: Neutralization is a technique sometimes required when using VHF crystals, as C2 may be large enough to allow the oscillator to free-run, instead of being locked to the frequency of L1-C1. However, it may also be used with advantage, as described below.]
You can neutralize C2 by adding an inductor across the crystal (ie in parallel with C2). The value required is that which parallel-resonates with C2 at the crystal frequency. In effect, C2 no longer exists. With C2 neutralized, there is no longer a sudden transition from the wanted series resonance F1 to the unwanted parallel resonance F2. The peak the response curve of the throughput of the crystal (at F1) is now nice and symmetrical, without the sudden cutoff at F2. In practice, the actual F1 peak will probably be somewhat more HF than before, and the crystal should be more pullable with a series capacitor.

Finally, if you reduce the value of the inductor so that its resonance with C2 is somewhat higher than the crystal frequency, this tends to pull the F1 resonance peak even higher in frequency. However, if you overdo this, the oscillation will probably unlock from the crystal, and start to free-run.

As I said, sorry for the ramble.
Ian.

If you do try an inductor across the crystal, make sure that you still
do have a DC blocking capacitor somewhere in the path to ground (as
provided by the existing C2 trimmer).

OMG are you kidding, don't be sorry. Thank you way so much!!! :-))) You should set your clock to way in the future and repost that message so it sticks around for a while. ;-)

So to make a long story short I need to put an inductor of roughly 400uH across the crystal to cancel the 5pF of C2. Wow that's a ton of inductance, but about 27 turns on a FT50-43 ferrite torroid ought to do it. I'll let you know how that works out. I found another crystal, unfortunately it's identical and possibly from the same batch. I haven't

tried it yet, but I'm not expecting any miracles. I'm tired of burning my fingers unsoldering parts, so I'm goint to tinker on the breadboard with another 602 set up just for the oscillator testing with capacitor changes. I will apply the new coil to the soldered up version though.

The receiver hears, as we just had a storm earlier and I could hear lightning crashes in the distance. In my narrow tuning range, I can hear what is likely the carrier of a broadcaster too, or maybe my TV. Later tonight when the band opens up some more, I should hear something from W1AW hopefully.

Thanks again

Yeah, I probably expect too much from it. On a side note, IT WORKS. I can hear stations, but the noise (man made) is something awful. It really needs a narrow audio filter.

I found some stuff on those, the look pretty neat. I may have to head to the dollar store and see what I can find. ;-)

As you say, at around 3.5MHz, you will need a fairly large inductor to
resonate with 5pF. An alternative might be to make a bridge circuit,
where you actually use another (5pF) capacitor to balance out the
unwanted 5pF. I used to use an extremely simple balancing circuit to
make accurate measurements of the resonant frequencies and ESRs
(equivalent series resistance) of VHF crystals, and it should be
possible to use something similar in an oscillator. However, maybe
someone out there can advise on a tried-and-tested circuit which will
definitely work. [There's no point in re-inventing the wheel!]

879. Microwave magnetron as a rectifier diode.

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-03-15 08:40:42 UTC
From: N9WOS <N9WOS@nobug.sbcglobal.net>
Message-ID: <eE7Kh.5359$JZ3.3832@newssvr13.news.prodigy.net>
Source record: 8068

The other thread got me thinking, so I pulled out some equipment to do a little test.

I looked through my stack of magnetrons to find the worst looking one for the experiment. I found one that I had pulled out of an old microwave that had been setting outside for a while. The outer case was heavily rusted to the point that it wasn't likely that I was ever going to use it as a replacement if I had a microwave that had a magnetron die in it. But the inner tube, and cooling fins was in good shape.

I made up a transformer with a secondary of 3.3V under load, to drive the filament. The filament current is about 12A. Total filament wattage is about 40W.

For testing applications, I used a 0 to 350V DC supply, with a maximum output of 200mA.

With magnets in place I could run the voltage up to 350V and only a few milliamps of current would flow. The needle on the meter of the field strength meter setting right by the antenna of the magnetron never moved. 350V is way to low for the electron stream to overcome the restraining force of the magnetic field, to allow anode current. Let alone generate enough radial electron velocity to start oscillations.

So, I took off the outer case off the magnetron tube assembly. I removed the two magnets. Then I hooked it up to the filament supply and checked it again. Without the magnets, it conducts a LOT more current at low voltages.

Here is the basic current voltage and plate dissipation readings.

50mA at 80V 4W
100mA at 134V 13.4W
150mA at 172V 25.8W
200mA at 220V 44W

Estimated 500mA voltage around 500V or 250W

Not quite as good as a 5U4 element.
But pretty close to the voltage drop you would see from a 5Y3 element.

With a PRV of well over 4KV. Probably easily 10KV. I don't have the equipment on had to see how high of a voltage it will take before it flashes over. The obvious limiting factor that I can see is the spacing between the filament terminals and the grounded case(plate) of the tube. With the tube I have, that is about 5/8 of an inch. The reference book I have shows the worst case breakdown situation(needle gap) to be about 20KV for that distance. Best case, about 40 KV. If the tube would flash over internally

first, is something I don't know.

Power supplies based on two magnetrons with the above specs.

For a 2KV 200mA 400W supply.......
A full wave supply with a 2.2KV-0-2.2KV transformer driving two de-maged magnetrons driving a filter choke.
It would drop about 200V in the magnetrons.
Power loss would be 40Wfiliment plus 20W plate loss, for a total loss of 60W each.
Total losses would be 120W at full load. 80W at no load.
77% efficient at full load.

For a 4KV 200mA 800W supply.......
A full wave supply with a 4.2KV-0-4.2KV transformer driving two de-maged magnetrons driving a filter choke.
It would drop about 200V in the magnetrons.
Power loss would be 40Wfiliment plus 20W plate loss, for a total loss of 60W each.
Total losses would be 120W at full load. 80W at no load.
87% efficient at full load.

For a 4KV 500mA 2000Wsupply.
A full wave supply with a 4.5KV-0-4.5KV transformer driving two de-maged magnetrons driving a filter choke.
It would drop about 500V in the magnetrons.
Power loss would be 40Wfiliment plus 250W plate loss, for a total loss of 290W each.
Total losses would be 580W at full load. 80W at no load.
77.5% efficient at full load.

The largest supplies you could probably make is a 10KV 500mA 5,000W supply with two tubes and an efficiency of 90%.

Or a 20KV 500mA 10,000W full wave bridge supply, with four tubes, with and efficiency of around 90%

There is a couple lower wattage magnetrons I have, that have a filament current around 8A. The largest one has a filament current around 15A

The neat thing is, you can see the glow of the filament through the ceramic ring on the top of the tube. The ceramic ring gives of a light orange glow.

Hope people on the news group find this info interesting, if not useful.

Thanks John. :-) I was referring to core saturation and when to suspect it/materials/etc, but I can sure stand to learn a few things more about crystals too. That's pretty good information in the link you posted. If anyone knows about crystals it should be Fox. ;-) I had never tried pulling one high before, only tweaking them down a little to get them on frequency. I can pull this one low several kcs without much of a problem other than stability, but it sure doesn't want to go any higher than about 500Hz above spec. I'm going try the parallel inductance trick to see if I can get the frequency higher, that should prove interesting. I like doing reality vs. theory experiments. ;-)

==========
I found an Archer packaged (for Tandy) cat no 270-092B Electret
Condenser Mike Element in its original Package, complete with response
curve.
From 30 - 3000 Hz the response is flat.
From 3000 Hz to 5000 Hz the response increases by approx 10 dB.
From 5000 - 9000 Hz the response drops such that it is back to its
original level at 9000 Hz .Above that freq the response drops.
Response curve is not extended beyond 12000 Hz

Just to set the record straight....

Someone suggested that you need to 'neutralize' the parallel resonance so the series resonance can be tuned toward it. This is completely wrong! The series resonance is, for practical purposes, invariant. The motional parameters (L and C) of the series resonance are such high reactances (small capacitance; high inductance) that external components have only a tiny influence on the series resonance.

The series resonant frequency is the lower of the two crystal 'resonances'. The parallel resonance is above it. When you make a VCXO with any substantial tuneability, you're probably operating the crystal at its parallel resonance. This leads to the common observation that you can 'pull' a crystal up in frequency more than you you can pull it down. You can only pull the parallel resonance to approach the series resonant frequency, but you can't pass it because the crystal is effectively a short-circuit at that frequency.

Also for the record, the crystal's quartz only has one fundamental and significant natural resonance - the series resonance. The so-called 'parallel resonance' is actually a controlled spurious resonance caused by the holder capacitance. At frequencies above series resonanve, the crystal's RLC equivalent looks inductive, and at some frequency the holder capacitance will resonate that net inductance.

Yes....this is the point of a VCXO...to allow an almost
infinitessimally small, but still useful, variation about the crystal
frequency while maintaining most of the crystal's stability.

> The series resonant frequency is the lower of the two crystal 'resonances'.

Nearly all VCXO's I've run across work the other way. You can pull
the frequency down substantially while maintaining good stability
(typically on the order of 0.1%), but not up. This certainly applies
to the circuit for which the original poster provided a link.

Do you have any examples of practical circuit schematics which use
parallel resonance and which can be pulled substantially up in
frequency ? I assume it should be possible to do with a parallel
inductor, for example in a Franklin oscillator circuit, but as was
pointed out the inductor values can be inconveniently large.

890. ? on neon light as static discharge device

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-03-16 13:37:30 UTC
From: Dave <db5151@hotmail.com>
Message-ID: <12vl7d0bq4bsu95@corp.supernews.com>
Source record: 8079

I saw somewhere that you could use an NE-2 bulb between the antenna "hot" lead and ground as a static discharge device for a receiver, but can't find an NE-2 and don't know anything about neon bulbs. Anybody know if a standard neon bulb rated at 125 VAC could be used in this manner? Or how I could test it? I'm thinking about charging up a 50V electrolytic capacitor and hitting the bulb with that, to see if it discharges the cap. I have a .22uF 630V mylar cap between the antenna and the input to the tuner because the 35V disc I had there got blown, so I know that static can be a problem with my setup even though it is grounded at two points.
Would welcome any ideas anyone has on how to make this work...

Thanks,

Dave

This was fairly common in WWII era radios.

A NE-2 fires at around 90-110V, which is more than a lot of solid state
equipment can handle, so the protection offered is dubious with modern radios.

That said, it certainly can't hurt anything to try it if you have some
weird problem with static.

You can still get them, but probably not locally.

Jameco (http://www.jameco.com/) still carried them last I looked.

To see where a particular bulb actually fires, put the bulb in parallel with
a capacitor and feed it with around a 100V or so DC though a resistor of
a few K.

You will have built a relaxation oscillator. The larger the cap and/or resistor,
the lower the flash rate.

If you don't have a 'scope to measure the voltage, increase the resistor
size until the flash rate is slow enough to watch the cap charge with a
voltmeter.

==========
To avoid building-up of static you can fit a say 47 Kilo Ohms
non-inductive resistor between what you call the 'hot' lead and earth.
This would not affect the received or transmitted signal.

I have fitted 2 non-inductive (carbon) 1 Watt resistors (47 KOhms) from
the incoming balanced feeder to earth at the Antenna Matching Unit.
This approach is obviously also OK with an incoming coax feeder.
At 100 W RF output the voltage would be 71 V at the transceiver. This
would dissipate a little over 0.1 Watt in the 47K resistor fitted at the
transceiver. Metal-oxyde resistors can for this purpose also be
considered as non-inductive.

I've got a set of four epoxy block diodes that I would like to use in my next home brew amplifier power supply. The problem is that the company that made them, CSdc (Conditioning Semiconductor Devices Corporation) was bought up back in the 80's and I can't find anything on the web about the value of the devices. I would sure like to know what C67-6225A by CSdc is. They are 1 inch square by 5.5 inches long black epoxy blocks. Any help would be greatly appreciated.
Thanks,

Ken K4XL

I should have added that you can't use the neon if there is a transmitter
attached to the same line.

Thanks for the reply, Jim.

While waiting I set up a charging system for a cap and then tested to see whether the bulb would discharge the cap. No go. I am sure that at a high enough voltage the bulb might help, but I am going to have to use a resistor in parrallel with the bulb, or some other setup, to guard against relatively low voltage static buildup.

Thanks for the relaxation osc. idea. I might actually use that in m search. Never would have thought of it.

Much appreciated...

Dave

Thanks for the input, Frank. I believe this, or something like it, is what I am going to have to do. I've already got the bulb installed in the receiver case, and I guess I'll leave it there to warn me of impending doom, but the resistor idea is what will probably save my bacon.

Is a metal-oxide resistor the same thing as a metal-film resistor? Or would that be inductive and mess with my incoming signal?

Thanks much,

Dave

BTW, this brings up another question: I have read that carbon composition resistors have a small amount of capacitive reactance due to the tiny particles that make up their mass, and should not be used for RF projects. But metal film resistors are inductive. So what kind of resistors should I be using in my RF projects? Is there a third type?

Thanks,

Dave

Most CB radios use a pair of back to back diodes across the receiver
input. I also recall the input of the ECG amplifiers also have the same
network to protect the Input circuitry from being blasted by the Pulse
from Defibrillator Paddles (1~5 KV.). These Back to back Diodes Clamp
the Voltage to the Forward Voltage Drop of the Diodes in question at
around 0.6 Volts. This circuit works much better and for cheaper than
the NE2 at ~60 Volts. If Static Electricity (lightning) is a problem at
a specific Frequency, a Grounded 1/4 wavelength shorted Stub could be
wired into the Feedline to present a DC ground to the entire antenna system.

Of course! Back to back diodes! Why didn't I think of that? Thank you,
thank you, thank you. How obvious! :)

But is there any way that I could still use my neon bulb to let me know if a
pulse of high-voltage static hits the input to the receiver? I would love
it if there were some way to make that still work...

Question on this last note: What if I put the back to back diodes in series with a 100K resistor, and they together in parrallel with the neon bulb. Would that slow the discharge of a fairly large static pulse enough to light the neon bulb, even briefly? I have the input to the receiver protected by a fairly high-voltage (non-electrolytic) capacitor, so I'm not too worried about the slowed-down pulse getting through to the rest of the circuit. And if it did get through it would find an air-gap transmitting variable capacitor next in line as the tuning cap. Is this a dumb idea, or might it behave as I desire? Any ideas?

Thanks,

Dave

>Just to set the record straight....
>
>Someone suggested that you need to 'neutralize' the parallel resonance so
>the series resonance can be tuned toward it. This is completely wrong!
It may be 'completely wrong', but my experience with getting out-of-spec
(too LF) VHF overtone crystals up to the required frequency indicates
that it does enable the oscillator to work at a slightly higher
frequency than it 'wants to'. This is because the throughput peak of the
series resonance moves HF when the sudden parallel resonance is removed.
[The assumption is that oscillation occurs at the peak of the series
resonance, which may not be entirely true.]

>The
>series resonance is, for practical purposes, invariant. The motional
>parameters (L and C) of the series resonance are such high reactances (small
>capacitance; high inductance) that external components have only a tiny
>influence on the series resonance.
This is more-or-less what I said. The influence of the relatively large
series trimmer capacitor will be pretty small.

>The series resonant frequency is the lower of the two crystal 'resonances'.
>The parallel resonance is above it. When you make a VCXO with any
>substantial tuneability, you're probably operating the crystal at its
>parallel resonance.
Lots of technical information calls the actual parallel resonance
'anti-resonance', and indicates that there is an 'area of parallel
resonance' between the true series resonance and the spurious parallel
resonance. In this area, the impedance of the crystal rapidly changes
from being zero (at the series resonant frequency) to infinitely
inductive (at the anti-resonant frequency). In many oscillator circuits,
the oscillation occurs neither at the series resonant nor the parallel
(anti-) resonant frequencies. Instead, the actual frequency of
oscillation will be determined by some value of this inductance and the
external capacitors, and also on the phaseshift and amplitude of signal
throughput through the crystal. All very complicated!

>This leads to the common observation that you can 'pull'
>a crystal up in frequency more than you you can pull it down. You can only
>pull the parallel resonance to approach the series resonant frequency, but
>you can't pass it because the crystal is effectively a short-circuit at that
>frequency.
And neither can you use external elements to pull the series resonance
very far HF, because it runs into the parallel resonance. From my

experience, a swept frequency response through a crystal shows that the throughput peak of the series resonant frequency never really reaches its full amplitude before it starts to get pulled down in parallel resonance hole. Neutralizing the shunt capacitance prevents the parallel resonance from occurring so close to the series resonance. As a result, the frequency response throughput curve becomes symmetrical, and the actual peak is somewhat further HF. Certainly, my oscillators (which were supposed to operate at the true series resonance of the crystal) DID move HF when I neutralized the crystal.

[Note that the full frequency response of a crystal with a parallel neutralizing inductor, from DC to well above the crystal frequency, consists of a broad notch centred on the crystal frequency (the parallel resonance of the parallel capacitance of the crystal and the neutralizing inductor). In the centre of the notch is a very narrow bandpass (the series resonance of the crystal).]

>
>Also for the record, the crystal's quartz only has one fundamental and
>significant natural resonance - the series resonance. The so-called
>'parallel resonance' is actually a controlled spurious resonance caused by
>the holder capacitance. At frequencies above series resonanve, the crystal's
>RLC equivalent looks inductive, and at some frequency the holder capacitance
>will resonate that net inductance.
Exactly so.

At the parallel (anti-) resonance, the reactance of the crystal suddenly jumps from being infinitely inductive to being infinitely capacitive (0p). As you move further HF, it stays capacitive, progressively decreasing in reactance. The parallel resonance therefore presents a brick wall, beyond which external capacitors cannot resonate with the inductive reactance of the crystal. However, if you neutralize the crystal, you kill the sudden transition from series to parallel resonance, and the frequency range over which the crystal is inductive is considerably extended. This should enable the resonance with external capacitors to extend further HF than when the crystal is not neutralized.

As I originally said, neutralization of the crystal was a suggestion, rather than a panacea. I still reckon that should work. It's worth a try. Unfortunately, the size required for the inductor (which resonates with the crystal parallel capacitance of appx only 5pF) is rather large. If neutralization DOES help, a brute force method of allowing a somewhat smaller inductor to be used would be to deliberately add MORE parallel capacity, and lower the value of the inductor to suit. A more elegant method would be to build the crystal into a simple bridge circuit, so that a neutralizing capacitor could be used instead of an inductor. However, I appreciate that the object of the exercise is to make a simple receiver, and it would be somewhat incongruous to need a very complicated circuit just for the crystal.

I have to agree with Joe. Basically there is no such thing as an
crystal oscillator in "parallel resonance". However there are
oscillators that use the crystal in the feedback path to add
substantial phase shift. Such as in the Pierce oscillator where it
behaves inductive. The phase shift changes so rapidly that it can
still make a low-drift oscillator.

In the book by Matthys where he compares various oscillators there is
one in chapter 10.6 where the deviation from the (series) resonant
point is the highest. It is a circuit where the crystal sees a very
high impedance as opposed to regular circuits where highest Q is
obtained with very low impedance. This in effect makes the crystal
load to be around C0 of the crystal with some output and input

capacitance. And therefore it is probably the smallest effective physical series capacitance obtainable and thus the highest frequency.

Looking up the Franklin oscillator you mentioned, I notice this also is providing a high impedance to the resonant elements. So yes, it seems a valid way of implementing an alternative to Matthys' example.

Now also cancelling the effect of C0 of the crystal by adding parallel inductance might push it a bit further. Right now I would not be able to predict the effect on loaded Q of the crystal. Lowering Q is normally not done, but in this case we are primarily in quest for wide pulling range right?

In a low impedance Butler (overtone) oscillator I have seen C0 cancellation by using parallel inductance as well. There sometimes is an L plus series R used to lower the Q of the L/C0 combination. This seems not appropriate for a high impedance oscillator circuit. I would expect best effect if the Q of the inductor is high (low Rs).

Sorry this is still theory. I have no examples of VCXO in this context.

Cheers,

Joop

Why would the inductance be of any concern? It would
be effectively in series with the resistance, thus raising the
device's impedance... I'd think that would lessen the
loading on receive or transmit signals.

It's only possible to pull a crystal a little way from its center
frequency
by external components. If you put a resistor in parallel with the
crystal (to lower its Q) you can increase the pull range.

The reason for the parallel inductance in the overtone mode is the
low impedance of the crystal self capacitance at high frequencies,
this on its own can be quite low, and the series resistance
at overtone can be quite high, so this can allow the tank circuit to
dominate rather than the crystal unless it is cancelled.

Not sure about the resistor not seeing the circuit.

the statement all crystal circuits operate in series mode stems from the
fact that the internal eq circuit of a crystal is a series LC, any
capacitance in parallel with the crystal can only be in series with the
internal motional capacitance.

If your lucky you may be able to find a spurious node, but it would be hard
to make it oscillate at this point.

I know why the inductor is usually necessary. The thing is that for
the purpose of the Butler the effect of C0 can be neutralized.
The question is whether it can be made to have a similar effect in the
"pulling arena" as well. Of course it should not have to much side
effects in normal operation of the oscillator.

In the overtone butler there is also another LC resonance circuit
present that determines the possible operating frequency (read desired
overtone). Such a thing might be necessary in most circuits where an
inductor is placed in parallel with a crystal.

These are interesting experiments, though if I wanted a high voltage diode from a microwave oven, I would be tempted to take the small one made from silicon instead.

What is the advantage over using several secondary windings, each with its own rectifier made from 1N4007 (or better) diodes, and then connecting the DC outputs from the rectifiers in series?

(or the standard old technique of using several 1kV diodes in series, with a capacitor and resistor in parallel with each diode, to keep the voltage sharing even)

Your "standard neon bulb rated at 125 VAC" probably contains a series resistor of maybe 100kOhms, and so will be not much use for protecting anything, because any current would develop too much voltage across the series resistor. If you open it up and remove the resistor then it will be able to shunt larger currents, though it still may not be ideal for protecting receivers. (The main advantage of the neon as a protection device is very low capacitance which could be important on the higher frequency bands, but another advantage would be that it would introduce practically no intermodulation even in very strong signal conditions, but the breakdown voltage is probably so high that it may not protect solid - state receivers very well, as someone else already mentioned. You can buy a ceramic cased gas discharge surge arrestor, they are popular for telephone circuits. e.g.:
http://www.epcos.com/inf/100/ds/ec350xx0810.pdf
)

You can probably make the bare neon bulb flicker by charging up something with static electricity (e.g. rub a balloon on your head or on a jumper) and then hold this near the bulb so you can hear crackling.

==========
Your expoxy embedded diode block is highly likely containing some 1000 V
PIV silicon diodes wired in series.
Suggest ,with a low voltage power supply, you allow 20 - 30 mA
(forward bias) current to flow through the block.
With the knowledge that the voltage across each silicon diode is approx
0.7 V you measure the voltage across the block ,and then can
determine the number of diodes and hence the overall PIV. The max AC
rms voltage to be rectified should be less than 35 percent of that
PIV, being 70 percent of half the PIV

The max current the block can accept can be ESTIMATED in 2 ways.
Allow a DC current to to flow such that after a while the block is
'hand warm' , alternatively the current at which the voltage across
the block has increased by 30 percent compared with the voltage across
the block at a current of 20 -30 mA

I agree the above methods do not constitute a very scientific approach
,yet they provide useful info for practical purposes.

I have done the same with some 'mystery' HV diodes and so far ....so good.

Suggest you test/verify the above method(s) with a HV diode from a
microwave oven with a known capacity .If not known ,the HV voltage of
the relevant transformer can be calculated (if not measured directly)
by connecting the primary winding to a low voltage (10 -15 V) and
measuring the voltage across the secondary.

Hey Chris,

Thanks for the input. I am wondering why a neon bulb would include a 100K resistor... To maybe lessen the current being driven through the bulb? I'm going to have to check that out. Still, I am thinking that a couple of back-to-back diodes each with a 100K resistor in series would probably do what I want. Going to try my hand at building a test-bed and give it a shot. Will check out the gas discdharge surge arrestor though. Sounds much simpler, and likely more reliable.

Appreciate your feeback.

The neon lamp works the same as a gas voltage
regulator--about 80 volts or so IIRC...
The resistor serves to limit the current.

Hello Pete,

I was actually thinking something similar, that the diodes would prevent any current from flowing through the circuit so long as the voltage remained on the small-signal level. And if a large pulse did come through, the inductance of the resistors would be the least of my worries. Any interferrance it caused in my receiver would be brief and likely go unnoticed. Does this sound plausible, or at least somewhat predictive of likely real-life events in the case of a static charge coming down the line?

You are missing the point........ :-)

Why would someone use a large heavy piece of equipment weighing up to several hundred pounds with several large heat generating glass things in them, several large metal cubes in them, with operating voltages ranging up to a thousand volts..... When they could use a little light square box, about the size of two bricks, with a fancy display, that runs off of an almost harmless 12V DC, and will do the exact same thing?

Because they want to!!!!!!!

Magnetron tubes are too neat looking to throw away, or leave unused.

I think that a set of magnetron tubes that have been removed from the cases, and set on a set of ceramic standoffs would have definite cool appeal in a HV power supply.

I wonder what the internal electrode to electrode breakdown voltage would be? That would be the PRV operating limit if you took a magnetron tube and put it in a one gallon paint bucket filled with mineral oil. It wouldn't have a problem with arcing over on the outside in that setup. Wouldn't need cooling fins on the tube any more, and you could put the filament transformer in the bucket with the magnetron. all you would have coming out of the bucket is the AC line running the transformer, and the two HV feedthroughs for the HV connections to the magnetron.

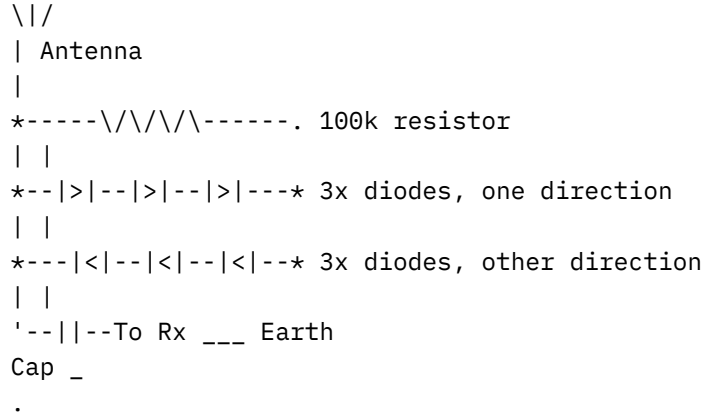
I think that the diodes with resistors in series will probably not be ideal.

If you want to just discharge small steady currents of static electricity being picked up by your antenna then all you need is a 100k (or 10k) resistor from the antenna to ground.

If you want to protect against voltage spikes (e.g. caused by distant lightning), (practically nothing will stop direct lightning) then your diodes, connected in parallel, and one pointing in each direction, will offer some protection, but in that case you must leave out the series resistors because the series resistors will stop the diodes from performing any useful function. If you are likely to experience strong radio signals that could produce more than 0.2V on your antenna (and I would guess that the answer is likely to be yes), then maybe the diodes will introduce intermodulation (a form of interference) into your signal. In this case, a number of diodes in series, in each direction, will allow larger RF signals to pass without excessive distortion.



For very high frequencies, small diodes such as 1N4148 may be needed, though for lower frequencies you may be able to get away with using larger, more robust diodes. At higher frequencies, big diodes may have too much capacitance.

This won't give all that much protection against powerful surges, so if your radio is especially valuable then a commercial protection device might be a good idea, and in any case unplugging the antenna when not in use would be sensible.

Instead of the above circuit using the diodes in parallel, you could also try using a pair of zener diodes in series, one pointing in each direction.

Chris

Why would the resistors disable the diodes? I expected they would merely
limit the current through the diodes...

I was thinking about Zener diodes, and trying to figure how they might be
applied. My only hesitation there is the power dissipation capabilities of
Zeners, compared to standard diodes.

The so-called 125 volt neon bulb is probably a 50 volt neon bulb with
a 47K to 150K resistor in series. Without the resistor it would draw
too much current from the 125 volt mains and either trip a circuit

breaker or destroy the NE-2 bulb, probably both.

An NE-2 bulb has a breakdown potential of approximately 50 volts (slightly more or less depending on external light conditions). If your transmitter never puts more than 50 volts on the feed line you could conceivably use this for a impulse suppression device, but bear in mind that it will not protect your receiver from voltages of less than 50 volts. Once the gas in a neon bulb reaches the breakdown point (50 volts in an NE-2) it becomes a short circuit until the voltage drops below the breakdown point.

If you are plagued by static build up on your antenna, and if your feed line normally operates at a low impedance (i.e. 50 ohms) you can use a 10K ohm 2-watt non-inductive resistor to bleed off the static build up. Do not use a wire wound resistor because it's inductance may have a negative impact on feed line SWR. If you want to prevent close-in lightning strikes from causing impulse voltage of over 50 volts you can use that NE-2, but there are better devices like the telephone protector that a previous post recommended. Many persons use a simple impulse protector that is homemade from two pointed sections of metal with one tied to your feed line and the other connected to a good earth ground. This method is documented in most ham radio antenna handbooks.

Hello! :-)

I'm interested in homebrewing. I've been a SWL since 1986, and I'm a newcomer to amateur radio, although I have been interested in that since then too, and will be getting my ticket during the course of the following year. I now own a Yaesu FT-757GX which I use as my HF Gen coverage receiver so I can still listen to SW, and practice code and then get my ticket, while working on building the rig and slowly learning still. Mind you, I also have a Fluke 8050A DMM too that I bought last year which will help me. (Still learning how to use it)

In an effort to help me learn more about electronics than I already know, not a whole lot at this point, I am going to build something with which I can use once I finally get my ticket.

In search for helpful documentation, I found a book by Randy L. Henderson, titled
"Build Your Own Intelligent Amateur Radio Transceiver". While now 10 years old, the book has many outdated components, and other errors in the book. While a good design idea, I think it could be improved on to 2006/2007 standards in many ways.. which I will attempt to do. The rig is based on the 80C31 / 8051 family with a 27C64 EPROM in with a 7805 regulator, and 74LS373 on the computer board. The computer board also listed as having: a 1N4001, a 1N4148, a 2N2222A, a 2N2907, and lastly a SK3444. It also featured a 100,000uF memory backup capacitor and a 6.2v Zener.

My basic dimensions for the chassis are 16.1875" W x 6.1875" H x 15" D.. so that will be the working envelope of whatever design I end up with. That's a pretty big space, and I like having space to work inside.

Well, anyhow this is my introductory post, and I'd love to hear your comments, suggestions, etc.

Do a google search regarding the code requirement on ham radio, and be prepared for a surprise.

You don't need to know the code to get a ham license any more. The FCC has dropped the code requirement for all licenses. Even extra.

You can get an extra and not even know what CW is.

Best of luck.

Well, I still think it best to learn it, especially in theory.. lots of beacons, etc. use it. I have no idea why they dropped it entirely. I know about the Feb. 23rd ruling. Oh, well...

Any help with my project is greatly appreciated.

My catchphrase of advice: "If you don't know how to do it, you don't know how to do it with a computer".

I don't know much about the book in question and the radio it builds, but the parts you name are all computer parts, not radio parts. My gut advice would be that you not build a computer but a radio :-)

My feeling is that if you want to do something that is a mix of analog and digital to do something interesting in radio, go through the SDR ("Software-Defined Radio") route. Google "software defined radio" along with ham to see some links to stuff that's been published in QEX

and other sources the past couple of years.

But I'd encourage you to also build some really, really simple regen receivers before doing anything that has a computer in it. The learning curve will be so much less steep, and you'll learn so much more about radio (as opposed to computers) by doing so.

More generically, also consider investing in the ARRL Handbook and Horowitz and Hill's _The Art of Electronics_. Neither are abstract academic texts, they are all about hands-on stuff. Together they will cost more than a good used ham rig, though they will pay off much more in the long run!

Tim.

926. Aldi 720 watt 230v AC/12v portable genrator.

Can I mention? -

If any of you want to go /P
Aldi is selling a generator for £50 tomorrow.

Russ

I quote-

"This smooth running suitcase type generator offers a reliable power source in inaccessible areas.
It is ideal for any number of uses including power tools, lighting, camping and other outdoor activities."

"Maximum output: 720 watts
Minimum output: 650 watts
2HP
Fuel tank capacity 7.5 litres
Fuel type: 50:1 petrol/oil mix
Speed: 3,000rpm
Starting system: recoil (electronic ignition)
Alternator: brushless self-exciting
Overload circuit breakers: 1 £ 230V and 1 £ 12V DC
AC power output: 1 £ 230V socket
DC power output: 12V battery charging
Charging lead and clips included
Noise: 62dBA at 7 metres, LWA 85
Turbo frame mounted and supplied with carry handle
Front reading voltmeter
Weight 21.7kg"

Wow. Thanks for the info on how the neon bulb works. I had no idea it
became a short once the gas was ionized, but now that makes sense.

I need to check out the pointed-metal device you describe. Sounds good, but
I am really trying to build the static protection into my RF amplifier so
that it goes wherever the amplifer goes. Afraid of someone scruffing their
feet on the carpet and touching the built-in extendable antenna.

Thanks, Arv, for the informative post. Much food for thought...

Dave

I have a similar small generator, which is very handy for running power
tools such as an electric drill or an angle-grinder... but switch-mode
mains power supplies do NOT seem to like the waveform if they are the
only load connected.

You already answered your question, Christian radio (and TV stations) can be found throughout your part of the Bible belt. Sadly, these promoters still don't "get the Internet and rural access" (part of this is due to alignment 'of some' that technology is bad)
IF they did -- you would not have an Internet access problem.
